In this [the Greek method of analysis] we have no trace of the systematic development of *geometric* truth, and the method was apparently regarded by the ancients themselves as imperfect. *Encyc. Brit.*, XV. 630.

orated style. See *decorated*.—**Geometric decoration**, decoration by means of straight lines or curves, or small surfaces bounded by such lines or curves, without the suggestion of plant or animal forms or the like. Frets and meanders, zigzags, checkers, circles, and triangles which frequently interlace with one another, forming elaborate star-shaped patterns, dog-teeth, notches of different kinds, and all similar forms, whether applied to a flat surface or carved in greater or less relief, are included in geometric decoration.—**Geometric elevation, locus**, etc. See the nouns.—**Geometric style**, in *arch.*, that development of the Pointed medieval architecture of England which includes the examples just previous to the most perfect artistic achievement of the style, or perhaps even the examples of highest excellence. It succeeded the Lancet or Early English style in the early part of the thirteenth century, and is characterized by the adoption of tracery, as yet in simple geometric forms, in broader windows, in place of the plain, narrow lancets of the preceding style, together with modifications of consistent character in wall-decoration and other sculptured ornament. With the advance of the thirteenth century, the severity and geometric simplicity of line in tracery and ornament became less marked, and the style passed gradually into the Decorated. See cut on preceding page.

Geometridæ (jē-ộ-met′ri-dē), *n. pl.* [NL., < *Geometra* + *-idæ*.] A large family of heterocerous lepidopterous insects or moths, named from the genus *Geometra*, whose larvæ are measuring-worms; the geometers, geometrids, phalænids, or *Phalænidæ*. This group, regarded as a family, is divided into 26 subfamilies, named *Urapterinæ*, *Ennominæ*, *Œnochrominæ*, *Amphidasinæ*, *Boarminæ*, *Boletobiinæ*, *Geometrinæ*, *Microcerinæ*, *Palyadinæ*, *Ephyrinæ*, *Acidalinæ*, *Mecocerinæ*, *Caberinæ*, *Macarinæ*, *Fidoniinæ*, *Hazinæ*, *Zereninæ*, *Liginæ*, *Hyberninæ*, *Larentiinæ*, *Eubolinæ*, *Sioninæ*, *Hedylinæ*, *Erateininæ*, *Emplocinæ*, and *Hypochrosinæ*. In some systems, as Guenée's, these are all elevated to the rank of families, ending in *-idæ*, and the superfamily thus constituted, called *Phalænites*, is the *Geometrina* of English authors. The names *Geometridæ* and *Phalænidæ* are exactly synonymous; and the various names resulting from the changes in termination of the two words are applied to what is practically an identical group of moths, rated higher or lower in the taxonomic scale, according to the classificatory views of different authors. See the extract, and cuts under *Cidaria* and *Haplodes*.

> The *Geometridæ* or Phalænidæ form a family of great size, being exceeded in numbers among the Lepidoptera only by the noctuids and tineids, and probably equalled only by the pyralids and tortricids. They are . . . widely distributed over the globe, and the caterpillars of many species have proved very destructive to some of our most important vegetable productions. The moths have rather long, slender bodies, the thorax without tufts or crests. Ocelli are present in some species, and absent in others. The antennæ are either simple, ciliated, or pectinated. The fore wings are large and triangular; the outer margin . . . is nearly as long as the hinder margin. The hind wings are ample. . . . In some [species], the females are wingless, or have only rudimentary wings, which are useless for flight. . . . The caterpillars are slender and naked, usually with two pairs of abdominal legs, though rarely they have three or four pairs. This deficiency causes them to move along with a looping gait, and hence they are often called "measuring-worms," from which fact the family name [*Geometridæ*] was given.

2. A text-book of geometry.—**Abstract geometry**, the general theory of the connections of more than two variables. Geometry, in its analytical treatment, appears as identical with the algebra of two or three variables. A similar study of the connections of a number of variables in general is called m-dimensional geometry, and abstract geometry as not descending to particulars.—**Algebraic, algorithmic, analytical, Cartesian, coördinate**, etc., **geometry**. See the adjectives.—**Common** or **elementary geometry**, that treatment of geometry which assumes no previous knowledge of the subject, and is supposed to be well known in all other mathematical writings.' This discipline remains in nearly the condition in which Euclid left it. See *Euclidean geometry*.—**Descriptive geometry** (invented by Gaspard Monge, 1794), the theory of making projections of any accurately defined figure such that from them can be deduced, not only its projective, but also its metrical properties. It is highly useful in engineering. (*b*) Modern projective geometry, commonly written in German *Geometrie der Lage*, to distinguish it from (*a*).—**Geometry of space, geometry of three dimensions**, geometry of figures not restricted to a plane or other surface.—**Geometry of the compasses**, a system of geometry in which the postulate that a right line be describable is not admitted, but instead links turn about pivots and are connected together. The first important discovery in this branch of geometry was the Peaucellier cell. See *cell*.—**Graphical geometry.** Same as *projective geometry*.—**Higher geometry**, any geometry not elementary; especially, modern synthetic geometry.—**Hyperbolic geometry**, a system which assumes that space, though infinite in measurement, has a real and definite boundary, separating the points at a real distance from points at an imaginary distance.—**Linear** or **line geometry**, the theory of systems of rays, congruencies, and complexes.—**Metric** or **quantitative geometry** treats of the distances of points or the magnitude of angles, arcs, surfaces, volumes, etc.—**Modern geometry**, the synthetic geometry which has been developed in the nineteenth century by Carnot ("Géométrie de position," 1803), Brianchon ("Mémoire sur les lignes du second ordre," 1817), Poncelet ("Traité des propriétés projectives des figures," 1822), Möbius ("Barycentrische Calcul," 1827), Steiner ("Systematische Entwickelung," 1832), Chasles ("Géométrie supérieure," 1852), Von Staudt ("Geometrie der Lage," 1847), and others.—**Organic geometry.** (*a*) A kind of geometry invented by MacLaurin (1719), in which more complicated curves are produced from less complicated ones. Hence—(*b*) Higher synthetic geometry in general.—**Parabolic geometry**, a system which assumes (in harmony with Euclidean principles) that the locus at an infinite distance consists of two coincident planes with an imaginary circle upon them.—**Plane geometry**, the geometry of figures all lying in one plane.—**Practical geometry.** (*a*) Surveying. (*b*) The art of geometrical drawing.—**Projective geometry**, a method of investigating geometry by the application of the theory of projections.—**Segmentary geometry**, modern synthetic geometry, especially when treated by means of the anharmonic ratio.—**Solid geometry.** (*a*) The elementary geometry of solid bodies. (*b*) Geometry of three dimensions.—**Speculative geometry**, the science of geometry proper, as distinguished from *practical geometry*.—**Spherical geometry**, the geometry of figures drawn on the surface of a sphere.—**Synthetic geometry**, geometry treated not by means of coördinates or other algebraic devices, but by means chiefly of projections.—**Theoretical geometry.** Same as *speculative geometry*.—**To hang by geometry†**, to have the clothes hang angularly, out of shape, or in rags.

In popular language often used specifically to denote the mature spores of fungi and of other lower cryptogams, especially of injurious kinds, and, in the case of bacteria, the entire organism.

Germ theory. (*a*) In *biol.*, the doctrine of biogenesis; the theory that living matter cannot be produced by evolution or development from non-living matter, but is necessarily produced from germs or seeds. The doctrine is opposed to that of abiogenesis, or spontaneous generation. See *biogenesis*. (*b*) In *pathol.*, the doctrine that zymotic diseases, together with some not usually classed as zymotic, are due to the presence in the body of living organisms. These organisms, which, so far as they have been positively identified, belong for the most part to the group of bacteria, produce their morbid effects by their

vital activity, and probably in large part by the formation of poisons called *ptomaines*. This doctrine no longer rests upon indirect evidence alone, but also on the positive identification of the peccant organisms in a certain number of diseases, as in phthisis, anthrax, relapsing fever, typhoid fever, and some others. =**Syn.** *Fetus, Rudiment.* See *embryo*.

German[2] (jėr′mąn), *a.* and *n.* [< L. *Germanus*, a. and n., German, *Germani*, n. pl., the Germans, *Germania*, Germany. The name is prob. of Celtic origin, and is said to mean 'shouters,' or, according to another explanation, 'neighbors.' The G. word for 'German' is *Deutsch*; 'a German,' *ein Deutscher*: see *Dutch*.] **I.** *a.* Of or pertaining to an important Teutonic race inhabiting central Europe, or to Germany, or to its inhabitants or their language. At the beginning of the Christian era the Germans occupied central Europe eastward to the Vistula, southward to the Carpathians and Danube, and westward to beyond the Rhine. Among their chief tribes were the Suevi, Lombards, Vandals, Heruli, Chatti, Quadi, Ubii, and Cherusci. After the epoch of migrations in the third and fourth centuries, many tribes, as the Franks, Burgundians, Lombards, and Vandals, settled permanently in other regions, and became merged in the new French, Italian, and Spanish nations. In the East the Germans were displaced by Slavs, although important parts of this region have since been Germanized. Since about the twelfth century the Germans have called themselves *die Deutschen*. In medieval and modern times they have occupied a region which has had many political changes, but which has remained of substantially the same extent for centuries. The former Roman-German empire contained various lands not inhabited by Germans. At the present time the Germans form the great majority in the reconstituted German empire; they number over one fourth of the inhabitants of Austria-Hungary, chiefly in the western and northwestern parts; there are about 1,000,000 Germans in the Baltic provinces and elsewhere in Russia, and over two thirds of the Swiss are of German race and language. Its progress was hindered by governmental interference and by internal disputes between the two chief leaders, Ronge and Czerski. After the reaction from the revolution of 1848 nearly all its members were gradually absorbed in other religious bodies.—**German duck.** See *duck*[2].—**German empire.** See *Holy Roman Empire*, under *empire*.—**German flute.** See *flute*[1], 1 (*c*).—**German fringe, gold, hone, millet**, etc. See the nouns.—**German paste**, a kind of paste composed of pea-meal, sweet almonds, lard, sugar, hay-saffron, and hard-boiled egg, used for feeding larks, thrushes, nightingales, and other singing birds.—**German plate-glass.** Same as *broad glass* (which see, under *broad*).—**German porcelain** and **pottery**, porcelain and pottery produced in Germany. The best-known varieties of German porcelain are those of Meissen (generally called Dresden) and Berlin. Other celebrated factories are those of Anspach, Höchst, Frankenthal, Ludwigsburg, Nymphenburg, and Grossbreitenbach.—**German sarsaparilla, silver**, etc. See the nouns.—**German sixth**, in *music*, a chord of the extreme sixth, containing the major third and perfect fifth of the bass, as shown in the figure.

II. *n.* **1.** A member of the German race, or a native or an inhabitant of Germany. See I.—**2.** The language of Germany or of the German people, a sub-branch or division of the Teutonic or Germanic branch of Indo-European or Aryan language. Its two principal divisions are the Low German, of the northern or lower part of the country, and the High German, of the southern or higher part. See *High German, Low German*, below. **3.** Especially, the literary language of Germany. It is one of the High-German dialects, the former court and official dialect of Saxony (though not entirely free from elements of other dialects), and was brought into general learned and literary use, early in the sixteenth century, by Luther's writings, especially by his translation of the Bible.—**High German**, a collective name for the dialects of central and southern Germany, as distinguished from the Low German of the north. The dialects it includes are many and of various groups, as Alemannic, Frankish, Austrian, etc. Its history is divided by the existing literary documents into three periods: Old High German, from the eighth to the twelfth century (the leading dialect Frankish, the literature chiefly Christianizing); Middle High German, from the twelfth to the sixteenth century (one of the leading dialects Swabian, the literature chiefly epic, as the *Nibelungenlied* and *Heldensagen*, and lyric, as the writings of the Minnesingers); and the New High German, or the Modern German, or German from the sixteenth century down. See above.—**Low German**, a collective name for the dialects of northern Germany and the Low Countries, among which the Netherlandish or Dutch and the Plattdeutsch have literatures at the present time. In a restricted sense, the name is applied to the Low German as spoken in the northern parts of Germany. It is divided historically into three periods, Old Low German, Middle Low German, and Modern Low German, corresponding substantially to the periods of High German. The dialects of the Teutonic invaders of Britain were of the Old Low German class. Specifically, in *bot.*: (*a*) The process of development of the embryo of a seed into a perfect plant. The conditions necessary for germination are the presence of moisture, free oxygen, as in atmospheric air, and warmth. Moisture softens the integuments of the seed and relaxes the tissues of the embryo, at the same time dissolving such nutrient matters in the seed as sugar, dextrine, etc., in readiness for their assimilation by the embryo. The absorption of oxygen is necessary for the chemical changes which always accompany growth. The degree of warmth needed to excite to action the vital forces of the plant varies in different species, some seeds, as those of wheat, being capable of germinating upon melting ice, while others require a temperature of over 60° F. During germination various chemical changes take place in the starch and other insoluble material stored up for the use of the embryo in the cotyledons or in the albumen of the seed, rendering them soluble and fit for assimilation, which changes are usually accompanied by an increase of temperature, as is seen in the process of malting. As an immediate result of the growing process thus excited and carried on in the seed, a root is produced which strikes downward, fixing itself in the soil and beginning to absorb thence nourishment for the new plant. At the same time the other extremity of the axis of growth is directed upward and develops a stem and leaves (*b*) The similar development of a plant from the spore in cryptogams. (*c*) The early period of growth in a bud, as of a bulb or of a rhizome. (*d*) The protrusion and growth of the pollen-tube from the pollen-grain.

germ-layer (jėrm'lā″ėr), *n.* In *biol.*, any blastodermic membrane or blastoderm; any layer of cells, forming a membrane, which enters into the structure of a germ in its early stages. The first is the single blastoderm of a blastula or vesicular morula. By invagination this germ-form becomes a gastrula, with two germ-layers, the hypoblastic blastodermic layer, or endoderm, and the epiblastic blastodermic layer, or ectoderm; development between which two of a third mesoblastic layer of cells, or mesoderm, and subsequent splitting of this into an inner and an outer layer, called splanchnopleure and somatopleure, results in the four germ-layers of most metazoic animals. Names of special germ-layers or germ-membranes are: *blastophylla*, *epiblast*, *mesoblast*, *hypoblast*, *endoderm*, *ectoderm*, *mesoderm*, *somatopleure*, *splanchnopleure*, etc. They are also called *layers*, as skin layer, serous layer, etc. See cuts under *gastrula* and *gastrulation.*

The Metazoa can alone be considered as true animals, and the origin from two primary *germ-layers* may be held to form the primary character of the animal kingdom.

The *germ-plasma* is regarded as a substance of peculiar chemical or even more special molecular composition, which passes over from one generation to another.
Jour. Roy. Micros. Soc., 1886, p. 213.

germ-pore (jėrm'pōr), *n.* In *cryptogamic bot.*, a pore or pit in the outer integument of a spore, through which the exit of the germ-tube takes place.

Many of these pores serve as places of exit for the tubular outgrowths from the spore at the time of germination, and may therefore be termed *germ-pores*; others perform no such function, and are therefore only simple pores or pits. *De Bary*, Fungi (trans.), p. 100.

germ-tube (jėrm'tūb), *n.* In *cryptogamic bot.*, a tubular or thread-like growth first formed by a spore in germination, which by continued development and cell-division in one or more directions becomes the thallus. In fungi the germ-tube may develop into either the ordinary mycelium or a promycelium.

germule (jėr'mūl), *n.* [< *germ* + dim. *-ule.*] A germ; especially, a small or incipient germ.

The majestic tree of human thought can never be comprehended unless regard is had to the formless *germule* of the psychical life of the zoophite, and ascending evolution is followed up in the animal series.
Tr. for *Alien. and Neurol.*, VI. 495.

germ-vesicle (jėrm'ves″i-kl), *n.* In *embryol.*, a germ in a vesicular state. It is either (*a*) a true germ-vesicle or blastula, preceding gastrulation, as in most animals, or (*b*) an intestinal germ-vesicle or gastrocystis, peculiar to mammals; in the latter case it follows gastrulation, and is generally confounded with a blastula; it is what is called in human anatomy the blastodermic vesicle. See *blastosphere*, *gastrocystis*, and cut under *gastrulation.*

Foreign writers often use *geysir* as an appellative, but the only Icel. words for hot springs are *hver* [*hverr*] (a cauldron, hot well) and *laug* (a hot bath [a bath]). The present *Geysir* is never mentioned in old writers, and it seems from a record in the Icel. annals that the great hot wells in the neighbourhood of Haukadale were due to the volcanic eruptions of 1294, when old hot springs disappeared, and those now existing came up. . . . The name *Geysir* (= *gusher*) must be old, as the inflexive *-ir* is hardly used but in obsolete words; . . . it was probably borrowed from some older hot spring" (Cleasby and Vigfusson); < *geysa*, gush, a secondary form, < *gjōsa*, gush: see *gush*.] A spouting hot spring; a hot spring which projects water, either periodically or irregularly, to some height in the air. The Great Geyser of Iceland has been long known, and has given the name to phenomena of this character. This geyser spouts very irregularly, and sometimes throws a large volume of water to a height of

nearly 100 feet. The height of the column is probably diminishing, as some old estimates make it much greater. There are numerous geysers in the Yellowstone region of the United States, some of which throw water to an elevation of 200 feet or more, and also on the North Island of New Zealand; and in the Napa valley of California are boiling springs that have been improperly called geysers. (See *boiling spring*, under *boiling*.) The true theory of the action of the Great Geyser of Iceland, and hence of geysers in general, was first established by Bunsen. The ejection of the water is caused by explosive action, due to the heating of the water, under pressure, in the lower part of

the geyser-tube, to considerably above the boiling-point. The heated water acquires after a time elastic force sufficient to overcome the weight of the superincumbent water; and the relief from compression during the ascent is so great that steam is generated rapidly, and to such an amount as to eject violently from the tube a great quantity of the water.

=**Syn.** *Ghastly*, *Grim*, *Grisly*, *Haggard*, *Hideous*: pale, wan, cadaverous, frightful. *Hideous* may apply to sound, as a *hideous* noise; the others not. All in modern use apply primarily to sight and secondarily to mental perception, except *haggard*, which connotes sight only. *Ghastly*, as it is most commonly used, means deathly pale, deathlike, referring to the countenance, but its signification has been extended to denote anything that is suggestive of death, or even repulsive and shocking, as Milton's "mangled with *ghastly* wounds" (P. L., vi. 398), "a *ghastly* smile" (*Milton*, P. L., ii. 846), a *ghastly* jest. *Grim* characterizes a rigid cast of countenance, indicating a severe, stern, or even ruthless disposition. *Grisly* refers to the whole form or aspect, especially when dark, forbidding, or such as to inspire terror. *Haggard* adds to the idea of paleness of countenance that of being wasted by famine or protracted mental agony. *Hideous*, used of looks, applies to the whole form or scene, and means simply repulsive, extremely unpleasant to see: as, *hideous* features, a *hideous* scene. See *pale*².

=**Syn.** *Ghost, Shade, Apparition, Specter, Phantom, Phantasm.* *Ghost* is the old word for the disembodied spirit, especially as appearing to man: as, the *ghost* of Hamlet's father; the *ghost* of Banquo. *Shade* is a soft and poetic word for *ghost*: as, the *shade* of Creüsa appeared to Æneas. An *apparition* is a ghost as appearing to sight, perhaps suddenly or unexpectedly; it may also be a fancied appearance, while a *ghost* is supposed to be real: as, Jupiter made a cloud into an *apparition* of Juno; Macbeth saw an *apparition* of a dagger; the witches showed him an *apparition* of a crowned child. A *specter* is an alarming or horrifying preternatural personal appearance, having less individuality, perhaps, than a *ghost* or *shade*, but more than an *apparition* necessarily has. A *phantom* has an apparent, not a real, existence; it differs from a *phantasm* in emphasizing the unreality simply and in representing a single object, while *phantasm* emphasizes the deception put upon the mind, and may include more than one object.

gilding (gil'ding), *n.* [< ME. *gildinge*; verbal n. of *gild*¹, *v.*] 1. The art of overlaying or decorating with gold. A great number of processes are employed, which may be divided into two chief classes, *mechanical* and *chemical*. The first includes all the common methods of gilding by laying gold-leaf or gold-powder upon an adhesive surface, as in sign-painting, house-decorating, etc. The soldering of gold to a cheaper metal and rolling both down to a thin sheet is properly gold-plating. The chemical processes in gilding include electroplating with gold, by applying gold in an amalgam and afterward driving off the mercury by heat, applying gold to metals by dipping them in a bath of some solution of gold, and enameling with gold on porcelain or glass, the gold being put on the ware as a paint and afterward vitrified in a furnace.

2. The art or practice of producing the appearance of gilding by the use of other materials than gold. Compare *gild*¹, *v.*—3. That which is laid on in overlaying with gold; hence, any superficial coating used to give a better appearance to a thing than is natural to it.

gill[1] (gil), *n.* [< ME. *gile*, *gylle*, < Dan. *gjælle* = Sw. *gäl*, a gill, = Icel. *gjölnar*, pl., gills (commonly *tálkn*); cf. dial. *ginner*, also *ginnle*, gill, appar. connected with Icel. *gin*, the mouth of a beast, which, with *gil*, a ravine (E. *gill*[2]), and perhaps *gjölnar*, gills, may be referred to the root (√ **gin*, **gi*) of *gin*[1], *begin*, *yawn*, *chasm*, *chaos*, etc.: see *gin*[1], *begin*, *yawn*, etc. Cf. Gael. *gial*, *giall*, a jaw, cheek, gill of a fish.] 1. The breathing-organ of any animal that lives in the water.

2. Specifically, an organ in aquatic animals for the aërification of the blood through the medium of water; the respiratory apparatus of any animal that breathes the air which is mixed with water; by extension, a branchia, as of any invertebrate and of the ichthyopsidan vertebrates. See *branchiæ*. The gills or branchiæ of a fish are a series of vascular arches by which the venous blood is brought in close relation with the water, and thus arterialized. They are situated on each side of the neck, and

A, first branchial arch of left side of black bass: 1, gill-rakers; 2, branchial lamellæ. *C*, same, in cross-section: 7, branchial lamellæ; 8, a gill-raker. *B*, same arch of striped-bass, with appendages removed: 3, 4, 5, and 6, pharyngobranchial, epibranchial, ceratobranchial, and hypobranchial segments.

consist generally of rows of compressed filaments arising from the outer sides of the gill-arches, between which are the gill-slits through which water is poured in respiration to bathe the gills, the set of gills being usually contained in cavities shut in by the gill-covers and communicating with the mouth. There are usually four rows of gills in true fishes, but there may be fewer; in selachians there are generally five pairs; the details of the arrangement are very various. In *Amphibia* the gills are similar to those of fishes in their situation and general character, but they usually present externally as tufted organs on each side of the neck, and in many cases are caducous, being replaced by lungs. In *Mollusca* the character of the gills is very different, and their disposition is so variable that they are made a means of establishing many of the orders and subordinate groups of that division of the animal kingdom. In an oyster, for example, the gills are the folds or plaits which lie in layers around a considerable part of the circumference of the animal. (See cuts under *Dendronotus*, *Doris*, *Lamellibranchiata*, and *Polyplacophora*.) In *Crustacea* the gills are commonly appendages of some of the legs, very variable in number and situation, as podobranchiæ, pleurobranchiæ, etc. (See *epipodite*, and cut under *Podophthalmia*.) Among *Insecta* gills are filamentous or foliaceous external appendages of the trachea of aquatic insects which breathe in the water. In *Arachnida* the gills are the external parts of the breathing-organ, each gill consisting of a minute slit covered with a scale; there are two or four of these on the lower side of the abdomen, near the base. In *Vermes* gills are the respiratory organs, of whatever character, commonly fringing the sides of the body or forming tufts on the head.

[Slang.]—**Tracheal gills**, dorsal respiratory appendages of insects into which trachea pass.

ML. *gilla*, a wine-vessel, *gello*, a wine-vessel, a wine-measure, etc.; perhaps from the same ult. source as *gallon*, q. v.] 1. A liquid measure, one fourth of a pint in the British and United States systems. The United States gill contains 7.217 cubic inches, equal to 118.35 cubic centimeters. The British imperial gill contains just 5 ounces avoirdupois of distilled water at 62° F., weighed in air under a pressure equal to that of 30 inches of mercury at London, being equal to 142 cubic centimeters or 1 2 United States gills. Until about 1825 the gill was not considered as part of the regular system of English measures of capacity, and there was some want of uniformity in the use of the name. (See the extract from Carew.) In the north of England and parts of Scotland a half-pint was called a gill. The Scotch gill was $\frac{1}{4}$ of a Scotch pint, and was therefore about equal to the English gill.

> They measure their block-tin by the *gill*, which containeth a pint. *Carew.*

One of a peculiar vagabond race which appeared in England for the first time about the beginning of the sixteenth century, and in eastern Europe at least two centuries earlier, and is now found in every country of Europe, as well as in parts of Asia, Africa, and America. The Gipsies are distinguishable from the peoples among whom they rove by their bodily appearance and by their language. Their forms are generally light, lithe, and agile; skin of a tawny color; eyes large, black, and brilliant; hair long, coal-black, and often ringleted; mouth well shaped; and teeth of dazzling whiteness. Ethnologists generally concur in regarding the Gipsies as descendants of some obscure Hindu tribe. They pursue various nomadic occupations, being tinkers, basket-makers, fortune-tellers, dealers in horses, etc., are often expert musicians, and are credited with thievish propensities. They appear to be destitute of any system of religion, but traces of various forms of paganism are found in their language and customs. The name *Gipsy* is also sometimes applied to or assumed by other vagrants of like habits.

O this false soul of Egypt! this grave charm, ...
Like a right *gipsy*, hath, at fast and loose,
Beguil'd me to the very heart of loss.

girder[1] (gėr'dėr), *n.* [< *gird*[1] + *-er*[1].] 1. One who or that which girds, binds, or encircles. Specifically—2. A main beam of either wood or iron, resting with each end upon a wall or pier, used to support a superstructure or a superincumbent weight, as a floor, the upper wall of a house, the roadway of a bridge, or the like. Wooden girders, when in two or more pieces, take the form of built-up beams, arched beams, or compound beams. When composed of upper and lower horizontal members, united by vertical and diagonal pieces, the girder is called a *lattice-girder*. When reinforced by iron rods a wooden beam may form a *trussed girder*. Iron girders

Girders (in cross-section)

a to *l*, wrought-iron girders; *m* to *s*, cast-iron girders; *aa*, box-girder; *bb*, compound I-girder; *cc*, compound-beam girder; *dd*, I-girder.

are simple or compound, and are made of cast-iron or wrought-iron, or both combined. The most simple form is the common rolled or cast **I**- or **T**-beam. Compound beams are composed of plate- and angle-irons built together in various forms, the most simple having a plate-iron web united to upper and lower plate-iron members by means of angle-irons. More complicated forms include girders with two webs (the *box-girder*), or with three or more webs, or with groups of rolled beams united. Iron girders also appear in many latticed forms, and are largely used in bridge-building. (See *bridge*, *girder-bridge*.) A very notable and extensive use of girders is in the structure of elevated railroads. Also called *girding-beam*.

What *girder* binds, what prop the frame sustains?

Lyly, Alexander and Campaspe, iii. 2.

girder-bridge (gėr'dėr-brij), *n.* A bridge in which the support is afforded by girders or beams. At the period of development of railway construction many bridges were built with cast-iron girders; the limit of safe span of such was generally accepted as 40 feet. This limitation, and the treacherous nature of the material, led to the substitution of wrought-iron formed into plates, which were placed vertically and strengthened and stiffened by angle-irons. The latter form of construction culminated in the box-girder bridge or tubular bridge. Bridges with framed girders are more generally called *truss-bridges* or *arched-girder bridges*. See *arched-beam bridge*, under *bridge*[1], 1.

girdle[1] (gėr'dl), *n.* [Early mod. E. also *gyrthelt*; < ME. *girdel, gordel, gurdel*, < AS. *gyrdel*, also *gyrdels* (= OFries. *gordel* = D. *gordel* = MLG. *gordel* = OHG. *gurtil, gurtila*, MHG. G. *gürtel* = Icel. *gyrdhill* = Sw. *gördel*), a girdle, < *gyrdan*, gird: see *gird*[1].] 1. A band, belt, or zone; something drawn round the waist of a person and fastened: as, a *girdle* of fine linen; a leathern *girdle*. The primary use of the girdle is to confine to the person the long flowing garments anciently, and still in some countries, worn by both men and women, and it is now frequently used in women's dress (commonly called a *belt*) and in military costume (a *belt* or *sash*). (See *cestus*.) The girdle has also served for the support of weapons, utensils, bags or pockets, etc. In the middle ages books were sometimes bound with a strip of flexible stuff hanging from one end of the volume, which could be drawn through the girdle and secured. Among many peoples, the girdle being large and loose, the scabbard of a sword or long dagger is passed through the girdle instead of being hung from it, a hook or projecting button serving to hold it in place. In ecclesiastical use the girdle is a cord with which the priest or other cleric binds the alb about the waist. Formerly it was flat and broad, and sometimes adorned with jewels, in the Roman Catholic Church it has been changed to a long cord with dependent extremities and tassels. It is regarded as a symbol of continence and self-restraint. It is usually of linen, though sometimes of wool, and is generally white, but sometimes colored to adapt it to the color of the other vestments.

Also called *pectoral arch* and *shoulder-girdle*. — **Pelvic girdle**, the girdle of the hind limb, consisting of the ilium, ischium, and pubis, in the higher vertebrates constituting the os innominatum or haunch-bone, articulated or ankylosed with the sacrum; in the lower vertebrates it may have additional pubic elements. It is a white, brittle, deliquescent solid.—**The glacial epoch**, a period of the earth's history when, as maintained by many geologists, an ice-sheet extended from the Scandinavian range in all directions, encroaching on Finland, northern Germany, and even a part of Great Britain; the glaciers of the Alps, Caucasus, and Pyrenees being also at that time considerably larger than they are now. Traces of former glaciation are observed in abundance over wide areas in northeastern North America, and are ascribed by most geologists to the former presence of an ice-sheet covering that region. The difficulty of accounting for the presence and movement of such a sheet on the American side of the Atlantic is much greater than is the case on the European side. Since in New England and the region of the great lakes much of the superficial detritus has been moved southward from the place of its origin for a greater or less distance, and since this fact was frequently observed and much commented on before ice became a recognized factor in geology, the phenomena now usually designated as *glacial* in Europe have been in America associated with the word *drift*; the loose material on the surface being called by that name, and the epoch of its accumulation, the *drift epoch*.

The word is little used in this sense except with some other word limiting or qualifying it: as, an advanced *glacialist*; an *ultra-glacialist* (one who is prone to magnify the importance of ice as a geological agent).

By a cursory glance the *glacialist* is led to believe that the markings must be referred to the streams of inland ice.
Nature, XXX. 203.

glaciated (glā'shi-ā-ted), *p. a.* Covered with ice; also, acted upon by ice; showing the effects of glacial action.

Rocky substances which have once been *glaciated*, if I may thus express the peculiar action of ice upon rocks, viz. the planing, polishing, scratching, grooving, and furrowing of their surfaces, can never be mistaken for anything else. *C. F. Hall*, Polar Expedition, p. 661.

On almost every *glaciated* surface in Maine may be found isolated drift scratches aberrant both in direction and outline. *Amer. Jour. Sci.*, 3d ser., XXX. 146.

glaciation (glā-shi-ā'shọn), *n.* [< *glaciate* + *-ion*.] 1. The act of freezing.

The water or other liquor usually beginning to freeze at the top, and it being the nature of *glaciation* to distend the water and aqueous liquors it hardens, it is usually and naturally consequent, that when the upper-crust of ice is grown thick, and by reason of the expansion of the frozen liquor bears hard with its edges against the sides of the glass contiguous to it, the included liquor (that is by degrees successively turned into ice), requiring more room than before, and forcibly endeavoring to expand itself every way, finds it less difficult to burst the glass than lift up the ice. *Boyle*, Hist. Cold, v.

2. The result of freezing; ice. [Rare.]

It [ice] is plain upon the surface of the water, but round in hayl, which is also a *glaciation*.
Sir T. Browne, Vulg. Err., ii. 1.

3. In *geol.*, the present or former existence of a mass of ice, glacier, or ice-sheet, covering a certain region; subjection to the action of ice. Thus, it is said that the surface of the country in Sweden exhibits the effects of a former *glaciation*—that is, that the surfaces of the rocks in many places are smoothed or striated, as they are under or near actual glaciers in the Alps or elsewhere. Such surfaces are said to be *glaciated*. 4. A consequence of or phenomenon caused by such a process or covering, as the striation and smoothing of rock-surfaces.

glacier (glā'shiėr or glas'i-ėr), *n.* [< F. *glacier* (orig. Swiss, > G. *gletscher*), < *glace*, ice, < L. *glacies*, ice.] The form in which the snow, falling on the higher parts of those mountain-ranges which are above the snow-line, finds its way down into the valleys. Under suitable climatic conditions, the snow which thus falls does not all disappear by evaporation, or melt at once and run off in the form of water, but becomes gradually converted into ice, and moves slowly down the mountain-slope in the depressions or valleys until it reaches a point where the mean temperature has so far risen that evaporation and melting counterbalance the supply from above. Here the glacier ends, and a stream of water begins, which is often the head of some large river, as the Gangootri glacier of the Ganges, or the Rhone glacier of the river of that name. The snow of the glacier is not transformed into ice at once, but passes through the intermediate stage of névé (German *firn*). (See *firn*.) Several subordinate glaciers often combine to form one large one, a result dependent on the topography of that part of the mountain-range in which the glacier takes its rise. The great glaciers, those of the first order, as the Gorner and the Aletsch glaciers in Switzerland, begin in large amphitheaters (*cirques*), where a considerable number of affluents are forced by the topographical conditions to unite in forming one great glacier. The ice-stream of the longest glacier in the Swiss Alps, the Gross Aletsch, was in 1880 10¼ miles in length; some in the Himalayas are four times as long. From the cliffs which overhang the glacier is always being detached, by frost and aërial erosion, more or less detritus, which is carried downward on the ice as it moves, and finally dumped at the terminus of the ice-mass. Such accumulations of debris are called *moraines*, and are very conspicuous on many glaciers. (See *moraine*.) The former greater extension of glaciers over certain regions has been, and still is, a subject of much discussion among geologists. See *the glacial epoch* (under *glacial*) and *ice*.—**Glacier tables**, large stones found on glaciers supported by pedestals of ice. The stones attain this peculiar position by the melting away of the ice around them, and the depression of its general surface by the action of the sun and rain. The block, like an umbrella, protects the ice below it from both; and accordingly its elevation measures the level of the glacier at a former period. After a time the stone table becomes too heavy for the column of ice on which it rests, or its equilibrium becomes unstable, whereupon it topples over, and, falling on the surface of the glacier, defends a new space of ice, and begins to mount afresh. *J. D. Forbes*.

glaciére (glas-i-ēr'), *n.* [F., < *glace*, ice; cf. *glacier*.] A cave, fissure, or depression of some kind in which ice remains permanently, although in quantity varying with the year and the season: sometimes called, in New England, an *ice-cave* or *ice-glen*.

Certain exceptional cases occur where, owing to the subsidence of the cold winter air into caverns (*glacières*), ice is formed which is not wholly melted, even though the summer temperature of the caves may be above freezing-point. *A. Geikie.*

glacieret (glā'shiėr-et or glas'i-ėr-et), *n.* [< *glacier* + *-et*.] A small sheet of ice or névé, lying under the snow-fields at the summits of the highest points in the Cordilleras, and exposed to view when after a series of exceptionally dry years the snow has nearly or quite melted away: a name given by J. Le Conte.

The glacierets are considered by some to be properly denominated *glaciers*, and by others to be something quite different from true glaciers.

glacionatant (glā-shiō-nā'tant), *a.* [< L. *glacies*, ice, + *natan(t-)s*, swimming: see *natant*.] Belonging to or affected by floating ice, as distinguished from ice moving on land.

The latter [attenuated edges, border of the drift] are thought to represent, one a glacial and the other a *glacionatant* action. *Science*, VIII. 157.

Dan., etc., *glacis*, < F. *glacis*, formerly also *glassis*, a slippery place, a sloping bank or causeway, a strong pent-house upon the walls or the rampart of a fortress, < OF. *glacis*, icy, slippery, *glacer*, formerly also *glasser*, < L. *glaciare*, freeze, harden: see *glaciate*.] A gentle slope or sloping bank. Sw. *gladiator*, < L. *gladiator*, < *gladius*, a sword (there is no verb **gladiare*): see *glave*.] **1.** In *Rom. antiq.*, one who fought in public for the entertainment of the people, either with other gladiators or with wild animals. Gladiators were at first prisoners, slaves, or condemned criminals; but afterward freemen fought in the arena, either for hire or from choice. Under the empire, knights, senators, and even women exhibited themselves in this way. Gladiators were first exhibited only on the occasion of public funerals, but afterward at entertainments of various kinds, and especially at public festivals given by the ædiles and other magistrates. They usually fought in the amphitheater, sometimes in the forum, sometimes at the funeral pyre. They were kept and trained in special establishments or schools, sometimes by persons who let them out for hire, sometimes by citizens who wished to exhibit them themselves. Gladiators were divided into different classes, according to their arms or mode of fighting. Thus, *retiarii* were such as carried a kind of trident and a net (*rete*), in which they endeavored to entangle their opponents, usually *secutores* (pursuers), who were lightly armed; *Thraces* were those armed with the round shield or buckler of the Thracians and a short sword or dagger; the *mirmillones* had an oblong shield curved to suit the shape of the body, and fought with either the Thraces or the retiarii. There were also those who fought blindfolded, their helmets being without eye-holes (*andabatæ*), in troops (*catervarii*), in chariots (*essedarii*), on horseback (*equites*), etc. In case the vanquished was not killed in the combat, the people were usually allowed to decide his fate. If they decreed his death, they extended their hands with the thumb bent and concealed (*premo*) by the clenched fingers; if they voted to spare him, they held out their hands with the thumb extended outward (*verto*). These precise gestures are still a subject of controversy, but the texts appear to support the version here given. Accord-

lug to a common interpretation, the downward gesture of the arm with fingers closed and thumb extended was the death-sentence, as shown in Gérôme's well-known painting "Pollice Verso." Gladiatorial shows were maintained for nearly seven hundred years, till the fifth century A. D

They drew into the sand freemen, knights, senators — yea, histories affirm that Commodus the Emperour did himself play the *gladiator* in person.

=Syn. *Gladness*, *Joy*, *Pleasure*, *Delight*, *Triumph*. *Gladness* is less often used of a weak feeling than *glad;* it generally stands for a feeling that is strong but tranquil, and showing itself chiefly in the face. Hence it is often used poetically of certain aspects of nature. *Joy* is more vivid and demonstrative. This distinction between *gladness* and *joy* is abundantly illustrated in the Bible. *Pleasure* is the most general of these words, representing all degrees of feeling, and vicious or harmful indulgence as well as harmless enjoyment. In its primary sense it indicates a feeling less distinctively cheerful than *gladness* and less profound or demonstrative than *joy*, but with much of glow. *Delight* is a high degree of *pleasure;* formerly the word was much used for low *pleasure* (see quotation from Milton under *delight*), but it has been redeemed so that it is now rarely used for anything but an ecstatic *pleasure* or *joy*. *Triumph* is often used for *joy* over success, especially *joy* in victory. All these words may express malign feelings, as *joy* in the adversities of a rival, except *gladness*, which generally expresses a pure and worthy feeling. See *animation*, *mirth*, *hilarity*, *happiness*.

They are paired, and normally have functional activity only in the female, though present in a rudimentary state in the male. See *mamma*[2].—**Meibomian glands** [named for H. *Meibomius*, who wrote at the end of the seventeenth century], the sebaceous follicles of the eyelids, secreting the greasy substance which lubricates the lids, and when excessive may gather at the corner of the eye, and there harden into the little bodies called *sleepy-seeds*. As the duct of the *mushroom-shaped gland* in the adult male [blatta] always contains spermatozoa, and no other organ containing spermatozoa is to be found, this gland has naturally been taken for the testis. Rajewsky, however, has recently pointed out that the true testes are situated in the tergal region of the abdomen. . . . He traces the efferent duct of the testes to the glands just mentioned.
Huxley, Anat. Invert., p. 359.

Nidamental glands, those glands which secrete the viscid substance by which the ova of some animals, as cephalopods, are invested and aggregated into various shapes.

A pair of so-called *nidamental glands* are the accessory organs of the female apparatus [of generation in cephalopods]; they consist of elongated lamellar tubes, which are placed in the anterior region of the animal; their short efferent ducts open beside the generative orifice. Their secretion appears to cement the ova together.

See *prostate*, *n*.—**Pyloric glands**, those gastric follicles which are most numerous near the pyloric end of the stomach, as distinguished from the *cardiac glands*.—**Rectal glands**, in certain insects, projecting ridges of the interior of the walls of the rectum, well supplied with tracheæ.—**Salivary glands**, those glands which secrete saliva. =Syn. 1. *Glare*, *Glisten*, *Scintillate*, *Glister*, *Glitter*, *Gleam*, *Sparkle*, *Coruscate*, *Glimmer*, *Flicker*. *Glare* indicates a steady, dazzling, or painful excess of light; *glisten* is a popular word, while *scintillate* is the exact or formal word, for a light that is unequal or is slightly interrupted: as, *glistening* eyes, dew, stars; *scintillating* stars. *Scintillate* is also used for the throwing off of sparkles: as, the *scintillating* iron at the forge. *Glisten* represents a softer, and *glitter* a harder, light than *glister*, *glitter* implying a cold, metallic ray: as, *glittering* bayonets; "all is not gold that *glitters*." *Gleam* stands for a small but generally steady and pleasant light, a long ray: as, the light *gleamed* through the keyhole; hope *gleamed* upon him. *Sparkle* represents a hard light that seems to be emitted irregularly in ignited particles or visible parts: as, *sparkling* diamonds, eyes, wit. *Coruscate* expresses a rapid throwing off of vivid or brilliant flashes of light, as in the aurora borealis or by a revolving piece of fireworks. *Glimmer* represents a faint and unsteady light: as, stars *glimmering* through the mist. *Flicker* goes further, and suggests, as *glimmer* does not, a probable extinction of the light: as, a *flickering* taper. I. *n.* 1. A substance resulting from the fusion of a combination of silica (rarely boracic acid) with various bases. See *entreous*. It is usually hard, brittle, has a conchoidal fracture, and is more or less transparent, some kinds being entirely so, while other substances to which the name of *glass* is commonly given are, in consequence of the impurity of the

material or imperfection in the manufacture, only slightly translucent. Glass is an inorganic substance, as would naturally be inferred from its being the result of fusion, but some organic substances are called vitreous. Some rocks have a vitreous structure, like that of artificial glass, as, for instance, obsidian, which is often called *volcanic glass*. (See *obsidian* and *lava*.) The slags produced in furnace operations are vitreous substances, but usually only translucent, and not transparent, because the vitrification is incomplete, and also because they are too deeply colored by metallic oxids. Glass, as the word is generally understood, is an artificial product, and one of the most important of manufactured articles. Its valuable qualities are: the ease with which it can be made to take any desired shape; cheapness, the result of the small cost of the materials of which it is made; durability, and especially resistance to decomposition by acids and corrosive substances generally; transparency, a quality of the utmost importance, as evidenced by its use for windows and in optical and chemical instruments; and the beautiful luster of those kinds which are used for ornamental purposes. Almost the only drawback to these good qualities of glass is its brittleness. The bases used in glass-manufacture are chiefly soda, potash, lime, alumina, and oxid of lead, and the quality of the article produced depends on the nature and amount of the basic material united with the silica. The combinations of silica with a simple alkaline base, either potash or soda, are soluble in water, and are known as *water-glass*. (See *soluble glass*, below.) They are useful substances, but very different in their properties from what is ordinarily known as *glass*. In addition to the alkaline base there must be an alkaline earth or a metallic oxid. The cheapest glass is that used for bottles; in this the basic material is chiefly lime, with some potash or soda, and alumina. Glass for medicine-bottles differs from ordinary bottle-glass in containing more potash than the latter, and also in the greater purity of the material used. Window-glass usually contains both soda and lime: here absence of any tinge of color is important, except in the most inferior qualities. Potash and soda render the glass more fusible; alumina diminishes its fusibility, lime makes it harder; lead gives luster, fusibility, and high refractive power. Hence, in glass which is to be cut and polished, where beauty is of prime importance, the base is chiefly oxid of lead, which amounts in some cases to half the weight of the material used. Glass in which lead is the essential base is called *crystal* or *flint-glass*. (See these words.) The finer kinds of glass without lead are called *crown-glass*. The tools employed by the glass-blower are simple, but require dexterity for their use. The process of manufacture depends on the fact that, at a very high temperature, glass is a liquid which can be readily cast; at a full red heat it is soft, ductile, and easily welded; when cold, it is hard and brittle. Glass to be serviceable must be annealed after the desired form has been given to it. This is done by heating it nearly to the melting-point, and then allowing it to cool very slowly in an annealing-chamber. By the action of hydrofluoric acid, which combines readily with the silica in glass, etching can be done on a glass surface. When cold, glass can be ground or cut upon a wheel, scratched by a diamond-point (by which means sheets of glass are readily divided or shaped, as they will break easily along the lines of such scratches), cut and depolished, or "ground" by a sand-blast, and brought to an exceedingly high polish. Specimens of Egyptian glass are in existence which can be dated back to about 2400 B. C.; in Egyptian sculptures of 4000 B. C. glass bottles are undoubtedly represented; and among the bas-reliefs of Beni Hassan, about 2000 B. C., various operations of glass-blowing are portrayed. In historical Egyptian, Phenician, and Roman antiquity, glass was in familiar use.

Specimens of Ancient Roman Glass. (From "L'Art pour Tous.")

The great quantities of examples of ancient glass vessels which have been exhumed from tombs, etc., formerly clear and transparent, are now as a rule characterized by a brilliant iridization like that of mother-of-pearl. This iridization is due to the imperfect composition of the glass, which has thus become affected by moisture during its stay under ground. Though well known to the Greeks, glass was in less common use among them, owing to the perfection of their ceramic ware. In Europe the most artistic manufactures of glass have been, since the middle ages, those of Venice, characterized by great elegance of form and lightness and thinness of substance, and those of Bohemia, of later date than the Venetian, and especially notable not only for grace of form, but for enameling, cutting, and engraved decoration.

Alabaster glass. See *alabaster*.—**Anaclastic glass** or **vial.** See *anaclastic*.—**Argentine, black, blue, broad, bronzed glass.** See the adjectives.—**Biar glass,** ornamental glassware made in the province of Alicante, Spain, especially that made in the sixteenth and seventeenth centuries.—**Bohemian glass.** (*a*) Ornamental glassware made in Bohemia, famous since the sixteenth century for the richness of the colors employed in its enameled decoration, and especially for its incised or engraved ornament in delicate patterns. (*b*) Glass having a lime base instead of a lead base, in this sense including nearly all the ornamental glassware, vessels, etc., of the best periods and styles, Venetian, Spanish, and others. (*c*) A kind of glass which is quite colorless, hard, difficultly fusible, and less readily acted upon by chemicals than any other kind of glass. Mirrors are often made of it, and it is largely used for the manufacture of chemical apparatus. It is made from ground quartz, purified potash, and lime.—

Incised Bohemian Glass.—Museum of Fine Arts, Boston.

Cameo-glass, in *Rom. antiq.*, a kind of artistic glassware formed from glass consisting of superimposed layers of different colors, the outermost of which was cut away so as to leave a design that appears in relief upon the layer underneath as a ground. Glassware of this kind, as originally produced by hand, is extremely costly from the difficulty of the cutting, but it is now imitated with comparative ease by machinery in the ware known as *cased glass*. The universally admired specimens of Greco-Roman cameo-glass include the famous Portland vase of the British Museum, the Auldjo vase in the same collection, and a beautiful amphora in the Museo Nazionale at Naples. In all these the design is in opaque white on a ground of dark, transparent blue, itself lined with opaque white. The same method was applied by the ancients to tablets or slabs, the interior lining of opaque white being sometimes omitted, and the ground being sometimes in opaque blue, purple, or brown. In rare examples several colors are introduced.—**Canary glass,** a bright-yellow glass colored by uranium oxid, having striking fluorescent properties.—**Cased glass.** See *case*[2], *v.*—**Cast glass.** Same as *plate-glass*.—**Claude glass.** See *Claude Lorrain mirror*, under *mirror*.—**Colored glass,** glass which is colored in the pot, whereas enameled glass is made by firing vitrifiable colors on a transparent or other ground. Compare *flashed glass*.—**Compressed glass,** glass which is tempered by being cast or pressed in chilled molds, a process perfected by Siemens of Dresden. It has a fibrous fracture, may be bored and polished by the wheel, and is believed to be stronger than glass tempered in oil, as in the Bastie process. *E. H. Knight.*—**Covered** or **coated glass,** glass prepared for stained-glass work, etc., by being coated with color on one side; flashed glass. Nearly all the ruby glass used in windows, etc., is of this character.—**Cryolite glass.** See *cryolite*.—**Cut glass,** flint-glass shaped or ornamented by cutting or grinding with polishing-wheels. The surface is commonly cut into grooves, so arranged as to leave prismatic and crystal-like projections between them. The work is done by rapidly revolving wheels of stone, iron, or wood, to the periphery of which sand, emery, and polishing-powder are applied.—**Devitrified glass,** glass which has been exposed to a great heat and in this way rendered opaque and hard, somewhat resembling porcelain. The process involves a partial crystallization of the previously amorphous mass.—**Diamond-cut glass,** thick glass which has been cut into V-shaped grooves or channels crossing one another at an angle, and leaving pyramid-shaped projections: a common form of ornament on cut glass.—**Diamond-molded glass,** molded or cast glass made to imitate the diamond-cut glass.—**Doubled glass,** a glass made of two or more colors superposed; flashed glass.—**Enameled glass,** glass which has been decorated with vitrifiable pigments, or painted according to the enamel method. See *glass-painting*.—**Erecting glass.** Same as *erector*, 1 (*b*).—**Filigree glass.** See *filigree-glass*.—**Flashed glass.** See *flash*[1].—**Franklin glasses,** spectacles the lenses of which are divided horizontally, each having different powers above and below.—**Glass-melting pot,** the vessel for melting the frit in glass-factories, made of refractory clay mixed with the ground substance of old pots.—**Glass of antimony,** a vitreous oxid of antimony mixed with sulphid.—**Glass of borax,** a vitreous transparent substance obtained by exposing to heat the crystals of biborate of sodium.—**Glass of cobalt.** See *cobalt*.—**Granulated glass,** glass the surface of which is raised in slight projections like grains of sand, used for ornamental vessels.—**Ground glass,** any glass that has been depolished by a sand-blast, by grinding, or by etching with acids, so as to break up light transmitted through it, and destroy its transparency.—**Half-minute glass,** a sand-glass used on shipboard to mark the time in heaving the log. See *log*.—**Hardened glass,** tempered or toughened glass.—**Heavy glass,** a technical name formerly given to English flint-glass.—**Kelp glass,** glass of which the alkaline ingredient soda is furnished by kelp. This process is now almost wholly abandoned.—**Kinkled glass,** glass the surface of which is raised in small rounded elevations produced by blowing the glass into a mold formed of a more or less fine netting of wire.—**Ladled glass.** Same as *cullet*[1].—**Madrepore glass,** a kind of glass in which star-like opaque colored patterns are crowded together in a transparent mass of glass. It is a variety of millefiori glass. See *mosaic glass*.—**Marbleized glass,** a glass which, while hot, has been immersed in water, then reheated and expanded by blowing. The incipient fractures become reunited, but show in the finished object like veins in marble. *E. H. Knight.*—**Matted glass,** glass ornamented by means of certain white or colored mineral powders, applied to the entire surface of the object, and then, in some cases, removed from those parts which are to appear as a dull ground. The glass is then fired, and the composition, which is very fusible, becomes fixed, the result being a bright pattern on a ground resembling ground glass.—**Metallized glass,** an ornamental glass with flakes of gold, mica, platinum, etc., scattered through it.—**Milk-glass.** Same as *cryolite glass*.—**Millefiori glass** [It. *mille*, a thousand, + *fiore*, a flower], ornamental glasswork made by fusing together tubes or rods of glass enamel (which see, under *enamel*) of different colors, or pieces of filigree. The fused mass is cut into sections, which appear as ornamental figures of varied design, and are embedded in white transparent glass to form paper-weights and objects of like character.—**Mosaic glass,** glass in which a number of pieces of different colors are fused together to form one mass. This is commonly done by means of glass rods, which are laid together sidewise, and after being united in one mass can then be cut across, producing a varied pattern at each section; these compound bars can be reheated and pulled out to any degree of tenuity, retaining the pattern at the cross-section on a smaller scale. Such rods are cut into slices for making millefiori glass, etc.—**Muller's glass.** Same as *hyalite*.—**Multiplying glass,** a toy consisting of a convex glass or lens cut with numerous facets, the effect of which is to repeat the image of the object observed as many times as there are facets.—**Murano glass,** glass made at Murano, near Venice. The greater part of the glass called Venetian has always been produced there, and all the modern Venetian glass-works are there.—**Musical glasses.** (*a*) A musical instrument consisting of graduated stripe of glass mounted on a resonance-box, so as to be played upon by hammers. (*b*) A musical instrument consisting either of glass tubes or glass bowls, graduated in size, which can be played by the friction of the moistened finger. Also called *glass harmonica*.—**Ondoyant glass** [*F. ondoyant*, ppr. of *ondoyer*, wave, undulate], a modern glass with an uneven waved surface, made in all tints, used in colored windows to imitate the subtle play and variation of light and color forming one of the characteristic beauties of medieval artistic glass.—**Opalescent glass,** glass having a changeableness of color somewhat like that of the opal, showing cloudy-blue, orange-red, and intermediate colors, according to the light in which it is viewed.—**Optical glass,** a flint-glass used in the manufacture of optical instruments. It contains a large proportion of lead, and hence is of great density.—**Painted glass,** glass ornamented by painting in vitrifiable pigments or enamels: often colloquially used to include colored or stained glass, and compositions in such glass. See def. 1.

Far more important than the introduction of the pointed arch was the invention of *painted glass*, which is really the important formative principle of Gothic architecture; so much so, that there would be more meaning in the name, if it were called the "painted-glass style," instead of the pointed-arch style. *J. Fergusson*, Hist. Arch., I. 526.

Platinized glass, plate-glass to which a thin film of platinum has been applied, transparent when held against a strong light, but capable of giving a reflection when the light is on the same side as the spectator. *R. H. Knight.* —**Pot-metal glass**, glass which has been tinted while in a state of fusion, and is therefore colored throughout its substance.—**Pressed glass**, glass brought to shape in a mold by a plunger.—**Reticulated glass**, a variety of filigree-glass in which two filigree cases or hollow cylinders are used, one within the other, for a glass vessel. The threads of opaque or colored glass, being set in opposite directions, produce the appearance of a reticulation. There is usually a small air-bubble in each mesh or space between the threads.—**Rice-stone glass**. Same as *alabaster glass*.—**Rolled glass**, an inferior quality of plate-glass for which the molten material is dipped from the pot with a ladle and rolled to the proper thickness on an iron table. —**Ruby glass**, glass of deep-red color. A good color is obtained by the use of copper, but the most beautiful is got by the use of gold. Ruby window-glass is generally flashed, else its color would be too dark, and it would appear hardly transparent. For the windows of photographic dark-rooms the copper ruby glass is used, as the photographic chemicals are sensitive to the light transmitted by gold glass.—**Silvered glass**. (*a*) A glass prepared for mirrors, having a metallic layer applied to one side of it. See *looking-glass*. (*b*) Glass made ornamental by the application of a white metallic film to the unexposed side, giving it a silvery luster.—**Soluble glass**, a silicate of potash or soda made by melting siliceous sand with a large proportion of alkali. The silica generally predominates. It is soluble in hot water, but is not affected by ordinary atmospheric changes, and is thus used to form a protective coating on plastered walls, etc. When used as a cement it is called *mineral lime*. Also called *water-glass*.—**Spun glass**, thin glass wire drawn from glass partly fused. When done on a small scale the glass is heated by the blowpipe, but other means are used where the material is produced in quantity.—**Stained glass**. (*a*) Properly, colored glass used in windows; particularly, such glass when formed into decorative windows or mosaics of transparent light. Windows representing designs in colored and enameled glass came into use early in the eleventh century, and attained perfection as compositions in gorgeous and jeweled yet harmonious color at the close of the twelfth and throughout the thirteenth century. After the thirteenth century, while much admirable work was done, the tendency asserted itself to paint pictures on the glass, following more and more closely the manner and ideals of ordinary opaque pictures, until in the course of the sixteenth century the art, having become grotesque, died out, and colored windows gave place to those of plain glass. During the present century this beautiful art has been revived, following the inverse process of its fall, so that the harsh, glaring, and perfunctory attempts of the early years of the modern medieval revival have now given place to work of real merit, in which the pictures are made to fill their true purpose of arrangements of glowing and transparent light, instead of imitating the methods of painting on an opaque surface. (*b*) Less properly, same as *enameled glass*. See *glass-painting*.—**Stopping the glass**. See the extract.

> During the last two or three hours the fireman or tiseur ceases to add fuel; all the openings are shut, and the glass is allowed to assume the requisite fluidity; an operation called *stopping the glass*, or performing the ceremony.
> *Ure*, Dict., II. 664.

Stove-glass, sheets of mica used in the fronts of stoves, etc.—**Tempered, toughened**, or **hardened glass**. (*a*) Glass hardened by being plunged at a high temperature into an oleaginous bath, according to a process invented by M. de la Bastie in 1875 and following years. Such glass cannot be cut by the diamond, and will endure heavy blows and great changes of temperature, but when fractured flies into minute fragments. (*b*) Glass that has been heated and then suddenly cooled, under the process of F. Siemens. When the articles to be made are such as are generally molded, the molten glass is run into suitable molds and squeezed while it is highly heated, the mold cooling it sufficiently without the liquid bath.—**To crush a glass**. See *to crush a cup*, under *crush*.—**To draw the glass**, to perform the operation of testing the glass, after the founding and refining are finished, to determine whether it is ready for casting. It is done by plunging the end of a rod into the pot.—**To get a glass in one's head**, to have one's drink go to one's head; become flustered with drink.

> It is common for a number of them that have *got a glass in their heads* to get up into some belfry and ring the bells for hours together for the sake of exercise.
> *Strutt*, Sports and Pastimes, p. 40.

Toughened glass. See *tempered glass*.—**Venetian glass**, ornamental glassware made at and near Venice. See def. 1. Sometimes called *Murano glass*, *Venice glass*.

glass-blower (glȧs'blō'ėr), *n.* One whose business is to blow and fashion glass.

glass-blowing (glȧs'blō'ing), *n.* The process of making glassware and window-glass by taking a mass of viscid glass from the melting-pot on the end of a blowing-tube and inflating it by blowing through the tube. For common window-glass the hot blown mass is extended into a long cylinder by swinging a bulb of hot glass from a bridge on which the workman stands. It is then cut open and flattened out in the flattening-furnace. For fine window-glass the bulb of blown glass is cut open and whirled round in the flashing-furnace till it flashes, or opens into a flat disk with a bull's-eye in the center. A small quantity of glass is also put into molds, and then expanded by blowing till it fills the molds. Blown glass is also cut and shaped while hot, and decorated, twisted, and united with other pieces of glass in many different ways. The term *glass-blowing* is also applied, though incorrectly, to the making of spun glass and filigree-glass by melting and molding rods of soft Bohemian glass in the flame of a blowpipe. Toys and ware made in this way are not properly called *blown glass*, but *filigree-glass*.

glass-cavity (glȧs'kav'i-ti), *n.* See *inclusion*.

Glass-crab (larva of *Palinurus*).

These larvæ are as thin as paper, flat and transparent, and have no resemblance to the adult.

glass-cutter (glȧs'kut'ėr), *n.* 1. One whose occupation is the cutting of glass, or the grinding of it into various ornamental forms.—2. That which cuts or is used for cutting glass.

glass-cutting (glȧs'kut'ing), *n.* The art of ornamenting the surface of glass vessels or ware by grinding it. The first or rough grinding is done with an iron wheel with sand and water, finer grinding with fine stone wheels, and finishing and polishing with wooden, cork, or brush wheels, or wheels covered with leather, india-rubber, or cloth, charged with emery-powder, pumice-stone powder, putty-powder, rouge, or other polishing material. Only flint-glass is used, and ware so treated is called *cut glass*. Glass is also said to be cut when treated by the sand-blast, whenever the work is more than a simple depolishing of the surface. See *sand-blast*.

glass-dust (glȧs'dust), *n.* Glass more or less finely powdered, used in the arts for grinding and polishing, and especially for the manufacture of glass-paper (which see). It is imported into the United States from those countries where glass is made in quantity, as Bohemia, and where refuse pieces are utilized in this way.

glass-making (glȧs'mā'king), *n.* The making of glass or glassware. After vitrification is complete and the scum of impurities or glass-gall which rises to the surface has been removed, the temperature of the furnace, which may have reached from 10,000° to 12,000° F., is considerably reduced, so as to bring the fluid and limpid metal into a condition of viscosity, rendering it capable of being worked. The working, by which means the glass is made to assume its definitive form, is in general performed by blowing (see *glass-blowing*), casting, or pressing in molds. See *flint-glass*, *glass-cutting*, *glass-furnace*, *plate-glass*.

glass-painting (glȧs'pān'ting), *n.* 1. The art or practice of producing designs in color on or in glass. In glass-painting (or glass-staining, as it is also called) two methods are chiefly employed: (*a*) the *enamel method*, consisting in painting on the glass in colors, which are then burned into it; (*b*) the *mosaic method*, consisting in forming a design of separate pieces of stained or colored glass set in cames of lead and braced and supported by a framework of iron bars, the color being imparted to the glass in the making. By this latter method were made the splendid medieval windows of the thirteenth century, the beautiful color-effects of which have thus far defied imitation, in spite of modern perfected methods. These admirable color-effects are now recognized to be due not only to perfection of the colors used, and to their judicious juxtaposition and skilful combination with white glass to relieve them and hinder where desirable the blending of contiguous tints, but to unevenness of tone and thickness of the glass primarily due to imperfect processes of manufacture. This last quality is now imitated with artistic success, such glass in general being made by hand, as ordinary machine-made glass is necessarily of even thickness and shade. A combination of the enamel and mosaic methods, known as the *mosaic-enamel method*, in which part of the design is in mosaic and part in enamel, is now commonly used.

glass-pot (glȧs'pot), *n.* A vessel or crucible used for fusing the materials of glass in a glass-furnace. Glass-pots are made of the most refractory earths or fire-clays by a tedious process, to insure the perfect uniformity and dryness necessary to enable them to resist the great heat of the furnace, and they constitute one of the chief elements in the cost of glass. The glass-pots for lead-glass (flint-glass and strass) are covered, and have an opening at the side; for all other kinds of glass they are open, with sloping sides, like pails without handles.

In one method a sheet of tin-foil is laid upon a marble table and painted with mercury till an amalgam is formed. More mercury is added to form a shallow pool, and upon this the sheet of glass is laid and pressed down to drive out bubbles. A thin film of amalgam clings to the glass, and forms the silver-like mirror. In another method a bath consisting in part of silver nitrate is employed, which forms an adherent film of silver on the glass. The second process is used in silvering hollow and convex glassware.

glaze (glāz), *n.* [< *glaze*, *v.*] **1.** A vitrifiable substance applied to the surface of fine pottery, stoneware, and porcelain. It is either a substance which can be applied directly to the biscuit in liquid form, or one, as common salt, the vapors of which, when it is placed in the furnace with the ware, will affect the surface of the latter in the manner desired. Porcelain glaze is an example of the first kind, and is a sort of translucent glass which combines with the paste sufficiently to form a perfect union with it, but retains a slight thickness through which the paste is seen. Salt glaze is the commonest instance of the second variety. Also called *couverte*, *covering*, *glazing*.

Great confusion has been caused in various works on pottery by a careless use of the terms *glaze* and "enamel"; they are both of the nature of glass, but the best distinction to make is to apply the word "enamel" to a vitreous coating that is opaque, and the word *glaze* to one that is transparent; both may be coloured.

See *aventurin*. — **Lustrous glaze**, a name given to the extremely thin glaze of certain kinds of pottery, especially Greek, Egyptian, etc., the exact composition of which is imperfectly known. This glaze is not generally very brilliant, although it varies in different pieces; but its slight gloss is almost indestructible, and was of importance in making the vessels water-tight. — **Marbled glaze**, a glaze for pottery colored with hues mingled in imitation of the veining of marble. — **Varnished glaze**, the glaze or enamel of pottery when applied in considerable thickness, as in most of the fine potteries of modern Europe.

Cowper, Charity, l. 86.

4. An artificial sphere on whose surface is drawn a map or representation of the earth or of the heavens, called in the former case a *terrestrial globe*, and in the latter a *celestial globe*. Terrestrial globes are made so as to revolve freely about an axis representing that of the earth. This axis turns in a vertical brass circle divided into degrees, or smaller divisions; and this represents the meridian of any station. This meridian has a motion in its own plane, so that the axis can be brought into parallelism with that of the earth at the assumed station. The meridian moves in a fixed horizontal circle of wood, called the horizon, which is divided into signs, days, etc. Cheaper globes are made without these circles. Celestial globes of the ordinary kind, with the drawing, as in terrestrial globes, on the outer or convex surface, represent the stars as they would appear in a mirror, or as if viewed from without the celestial sphere, and not as they appear on a map of the heavens; but globes are also made with the heavenly bodies represented on the inner surface as they appear from the earth.

See *mine*.—**Horizon of a globe.** See *horizon*.—**Meridian of a globe.** See *meridian*.—**Syn.** 1 and 2. *Globe*, *Sphere*, *Orb*, *Ball*. *Globe* and *sphere* represent that which is either perfectly round or closely approaches roundness: as, the earth is not a true *sphere*. *Ball* is freer in this respect: as, the eyeball; the *ball* of the foot; the Rugby foot-*ball* is oval. A *globe* is often solid, a *sphere* often hollow. The secondary senses of *globe* are physical, those of *sphere* are moral. *Sphere* is the term of geometry and astronomy; *orb*, of poetry, heraldry, and ancient astronomy. See *earth*[1].

Globigerinæ (glob'i-je-rī'nē), *n. pl.* [NL., pl. of *globigerina*.] Same as *Globigerinidæ*.

It is no less certain that at all depths down to 2400 fathoms or thereabouts, *Globigerinæ* in all stages of growth and containing more or less protoplasmic matter are found at the bottom, mixed with the cases of the surface Diatoms and the skeletons of Radiolaria. The proportion of *Globigerinæ*, Orbulinæ, and Pulvinulariæ in the deep-sea mud increases with the depth, until, at depths beyond 1000 fathoms, the sea-bottom is composed of a fine chalky ooze made up of little more than the remains of these Foraminifera and their associated Diatoms and Radiolaria.
Huxley, Anat. Invert., p. 80.

globigerina-mud (glob'i-je-rī'nā-mud), *n.* A chalky mud or ooze occurring in enormous deposits on the bottom of the ocean, largely consisting of the debris of the shells of *Globigerinidæ*.

globigerina-ooze (glob'i-je-rī'nā-ōz), *n.* Same as *globigerina-mud*.

If we suppose the globe to be uniformly covered with an ocean 1000 fathoms deep, the solid land covering its bottom would be out of the reach of rain, waves, and other agents of degradation, and no sedimentary deposits would be formed. But if Foraminifera and diatoms, following the same laws of distribution as at present obtained, were introduced into this ocean, the fine rain of their silicious and calcareous hard parts would commence, and a circumpolar cap of silicious deposit would begin to make its appearance in the north and in the south; while the intermediate zone would be covered with *globigerina ooze*, containing a comparatively small proportion of silicious matter. The thickness of the . . . beds thus formed would be limited only by time and the depth of the ocean. . . . The beds of chalk which underlie the nummulitic limestone and occupy a still greater area are essentially identical with the *globigerina ooze*, the species of Globigerina found in it being undistinguishable from those now living. *Huxley*, Anat. Invert., pp. 80–82.

Globigerinida (glob'i-je-rin'i-dạ), *n. pl.* [NL.] Same as *Globigerinidæ*.

Globigerinidæ (glob'i-je-rin'i-dē), *n. pl.* [NL., < *Globigerina* + *-idæ*.] A family of chiefly pelagic foraminiferous rhizopods, with the perforate test free and calcareous, its several chambers inflated or globose and arranged in a turbinate spiral, the aperture simple or multiple and conspicuous, opening into an umbilical depression, and no supplementary skeleton or canal system. The family occurs from the Trias to the present day, and the remains of its individuals constitute much of the chalky mud found at the bottom of the sea, as well as vast extents of limestone. Like other foraminifers, they were originally mistaken for and described as minute cephalopods, owing to the form of the chambered shells. But they are protozoan animalcules, whose soft parts consist of apparently structureless protoplasm, like that of other foraminifers and of rhizopods in general, which has the power of secreting lime and building of this substance a shell of characteristic form. The *Globigerinidæ* are prominent, among many related forms of foraminifers, for the profusion in which they occur, their myriads having furnished the material for considerable of those parts of the earth's crust which consist of limestone. In this respect the globigerines resemble nummulites, but they are still in existence, and in the present formation of globigerina-mud at the bottom of the ocean is witnessed a process by which solid rock may be formed from the hard chalky shells of microscopic organisms whose soft parts have long since perished. See *Foraminifera*. Also *Globigerina*, *Globigerinida*.

gloria (glō'ri-ą), *n.* [L., glory: see *glory*.] 1. In *liturgics*, the great doxology (Gloria in Excelsis) or the lesser doxology (Gloria Patri). See below.

2. A musical setting of one of these doxologies.—**3.** In general, a doxology or ascription of praise.—**4.** In *eccles. art*, a glory: often incorrectly used for *halo* or *aureole*.—**Gloria in Excelsis**, the hymn or chant beginning in Latin with the words *Gloria in Excelsis Deo* (Glory in the highest to God), and in the English version with *Glory be to God on high*. The first two clauses are given in Luke ii. 14, as sung by angels; and both this shorter form, as sung in churches in early times and still in use in some Oriental offices, and the enlarged form are therefore known as the *angelic hymn*. In some Eastern liturgies it stands at the beginning of the eucharistic office. In Western rites it is found at the beginning of mass, after the introit and kyrie, and before the collect, as in the Roman missal, and also in the Use of Sarum and in the Anglican Prayer-Book of 1549. In revisions of the Anglican Prayer-Book since 1552 it has stood at the end of the Communion Office, after communion and a prayer of thanksgiving. In the American Prayer-Book it is also an alternate to the Gloria Patri after the last psalm at Morning and Evening Prayer. In the Greek Church it is used after the psalms called lauds (*αἶνοι*) toward the end of the matin service, and at complin (*ἀπόδειπνον*) after Psalm cxlii. Also called, especially in the Eastern Church, the *great doxology*.—**Gloria Patri**, the short hymn, "Glory be to the Father, and to the Son, and to the Holy Ghost. As it was in the beginning, is now, and ever shall be, world without end. Amen." (In the Latin form, "Gloria Patri, et Filio, et Spiritui Sancto. Sicut erat in principio, et nunc, et semper, et in sæcula sæculorum. Amen.") This ascription has been used since very early times in both the Eastern and Western churches. Also called the *lesser doxology*.—**Gloria Tibi**, the brief doxology — in Latin, "Gloria tibi, Domine"; in the English version, "Glory be to thee, O Lord"—said after the announcement of the liturgical gospel in Roman Catholic and Anglican churches. In the Eastern Church the form is, "Glory be to thee, O Lord, glory to thee" (*δόξα σοι, Κύριε, δόξα σοι*), and this is repeated after the gospel. In the East the Gloria Tibi is as old as the fifth century or older; in the West it is not mentioned till later.

The explanation, translation, or definition of such a word; an explanatory note or remark upon some word or passage in a text, especially one written in the margin, or, as was the practice with the earliest glosses, between the lines. Such glosses, usually as explanations of Latin, Greek, or Hebrew words in the vernacular Teutonic, Celtic, or Romanic tongues, or as Latin equivalents of words in these tongues, abound in medieval literature, and are philologically among its most important remains.

2. A miser. [Obsolete or prov. Eng. in both senses.]

gluc-. In the following words, of recent introduction, the equivalent of the regular *glyc-*.

glucic (glō′sik), *a.* [< Gr. γλυκύς, sweet, prob. = L. *dulcis*, sweet: see *dulce*, *dulcet*, *douce*.] Of or pertaining to or obtained from sugar.—**Glucic acid**, $C_{12}H_{16}O_9$, an acid produced by the action of alkalis or acids on sugar. It is a colorless amorphous substance, is very soluble in water, attracts moisture rapidly from the air, and its solution has a decidedly sour taste. All of its neutral salts are soluble.

glucina (glō-sī′nȧ), *n.* [NL., < Gr. γλυκύς, sweet.] The only oxid (BeO) of the metal glucinum or beryllium. Pure glucina is white, tasteless, without odor, and quite insoluble in water, but soluble in the liquid fixed alkalis. Also *glucine* and *beryllia*.

glucinum (glō-sī′num), *n.* [NL., < Gr. γλυκύς, sweet.] Chemical symbol, Be or Gl; atomic weight, 9.1. A white metal, of specific gravity 2.1. It belongs to the group of the alkaline earths, and is prepared from beryl (whence it is also called *beryllium*). Native compounds are rare. Besides the common mineral beryl, it occurs in the oxid chrysoberyl, in the silicates euclase, phenacite, and bertrandite, and a few others, also in the phosphates herderite and beryllonite; the last-named is a phosphate of beryllium and sodium. Many of the salts of this metal have a sweet taste.

glucohemia, glucohæmia (glō-kō-hē′mi-ą), *n.* [NL. *glucohæmia*, < Gr. γλυκύς, sweet, + *αἷμα*, blood.] In *pathol.*, the presence of an excessive quantity of glucose in the blood.

glucometer (glō-kom′e-tėr), *n.* [< Gr. γλυκύς, sweet, + *μέτρον*, a measure.] An instrument for testing the percentage of sugar in wine or must.

glucose (glō′kōs), *n.* [< Gr. γλυκύς, sweet, + *-ose*.] 1. The name of a group of sugars having the formula $C_6H_{12}O_6$, which may be regarded as aldehydes of hexatomic alcohols. They are less sweet than cane-sugar. One or more of them constitute the sugar of fruits, and they are produced from cane-sugar, dextrine, starch, cellulose, etc., by the action of acids, certain ferments, and other reagents, and by processes going on in living plants. The two best-known varieties, distinguished by their action on polarized light, are dextroglucose, dextrose, or grape-sugar, which turns the plane of polarization to the right, and levoglucose, levulose, or fruit-sugar, which turns it to the left.

2. In *com.*, the sugar-syrup obtained by the conversion of starch into sugar by sulphuric acid, the solid product being called *grape-sugar*, *starch-sugar*, *diabetic sugar*, etc.

glucosic (glō-kos′ik), *a.* [< *glucose* + *-ic*.] Pertaining to, of the nature of, or producing glucose.

> According to M. Bulgnet's investigations, the cause of the change of the primarily formed cane sugar into fructose is not the acids of the fruits, but appears to depend on the influence of a nitrogenous body playing the part of a *glucosic* ferment. *R. Bentley*, Manual of Botany, p. 783.

glucoside (glō′kō-sid or -sīd), *n.* [< *glucose* + *-ide*[1].] One of a class of compounds widely distributed in the vegetable world, which, treated with acids, alkalis, or certain ferments, are resolved into a sugar, an acid, and sometimes another organic principle. Tannic acid, for example, is a glucoside resolvable into glucose and gallic acid. The glucosides may be regarded as compound ethers.

glucosuria (glō-kō-sū′ri-ą), *n.* [NL., < Gr. γλυκύς, sweet (see *glucose*), + *οὖρον*, urine.] In *pathol.*, the presence of glucose in the urine. See *diabetes*.

It is also employed by textile colorists, for the reason that its solutions are precipitated by tannic acid, and the precipitate so produced attracts many of the coal-tar colors from their solutions. In this respect it serves as a fixing-agent for the tannic acid; but as a nitrogenous albuminoid substance, it may at the same time act as a mordant. A kind of glue is made in Japan from *Gloeopeltis intricata*, which is used to stiffen thread, to cleanse and soften the hair, for painting on porcelain, and for attaching paper hangings to plastered walls.

> Therefore he that keepeth that one only commaundement of loue keepeth all. With this *glue* shall we be fast ioyned to Christ, so that he be in us, and we againe in him. *J. Udall*, On John iv.

It forms solid cakes, which are readily soluble, and for use may be moistened with the tongue.—**Vegetable glue**. See the extract.

For 250 grains of the concentrated gum solution (prepared with two parts of gum [arabic] and five of water), two grains of cryst. aluminum sulphate will suffice. The typical and best-known genus of the family *Glyptodontidæ*; the long-tailed fossil armadillos or glyptodons, with 5 toes on the hind feet and 4 on the fore, the fifth digit of which is wanting. The superficial resemblance to tortoises is striking; the feet are like those of some turtles, and, as in chelonians, the head could be withdrawn into the shell, though the rest of the vertebral column is a solid tube. The genera are several and the species rather numerous.

They rejected the literal interpretation of the Scriptures, and attempted to combine their teachings with those of the Greek and Oriental philosophies and religions. They held that God was the unknowable and the unapproachable; that from him proceeded, by emanation, subordinate deities termed *eons*, from whom again proceeded other still inferior spirits. The Gnostics were in general agreed in believing in the principles of dualism and Docetism and in the existence of a demiurge or world-creator. Common or White-tailed Gnu (*Catoblepas gnu*).

the antilopine division of the family *Bovidæ*; a wildebeest. The gnu has little of the appearance of an ordinary antelope, being a creature of singular shape, strangely combining characters which recall at once horse, ass, and ox. There are two very distinct species, the common gnu, *C. gnu*, and the brindled gnu, *C. gorgon*, sometimes generically separated under the name *Gorgonus*. The former stands about 4 feet high at the withers, and is about 5½ feet long; the shoulders are hunched; the neck is maned like an ass's; the tail is long and flowing like a horse's; the head is like a buffalo's, with a broad muzzle, and beset with long bristly hairs; other long hairs hang from the dewlap and between the fore legs; there are horns in both sexes, in the male massive, meeting over the poll, then curving downward and outward and again turned up at the tip, like a muskox's; the color is brownish or blackish, with much white in the tail and mane. The brindled gnu is a larger animal, striped on the fore quarters, with black tail and more copious mane; it is known as the *blue wildebeest*, and by the Bechuan name *kokon* or *kokoon*. Both species inhabit southerly parts of Africa, in company with zebras and quaggas, and usually go in herds like other antelopes.

go (gō), *v.*; pret. *went*, pp. *gone*, ppr. *going*. [Sc. also *gae*; < ME. *go*, *goo*, *gon*, *goon*, earlier *gan* (pret. *code*, *gede*, *yede*, *yode*; also *wente* (prop. the pret. of *wenden*: see *wend*), ppr. *goande*, *goende*, pp. *gon*, *gan*), < AS. *gān* (pret. *ēode*, ppr. not found, pp. *ge-gān*) = OS. *gān* = OFries. *gān* = D. *gaan* = MLG. LG. *gān* = OHG. *gān*, *gēn*, MHG. *gen*, G. *gehen* (= mod. Icel. *gā* = Sw. *gå* = Dan. *gaa*, of Lat. origin); not in Goth. (except in the pret. *iddja*) nor in early Scand.; a defective verb, generally regarded as a contraction of the equiv. AS. *gangan* = Goth. *gaggan*, etc., E. *gang*, with which it has been long confused (see *gang*); but such a contraction is otherwise unexampled (the contraction in AS. *fōn*, take, *hōn*, hang, from the fuller form represented by the E. *fang*, *hang*, q. v., being different), and is, on phonetic and other grounds, improbable. The form of the appar. root (Teut. √ *gai*), the form of the pret. (AS. *ēode*, Goth. *iddja*), and the fact that the prolific and widespread Indo-Eur. √ *i*, go, is otherwise scarcely represented in Teut. (unless in OHG. *ilen*, G. *eilen* = Dan. *ile* = Sw. *ila*, hasten; AS. *īle* = OFries. *ile* = Icel. *il*, the sole of the foot), give some probability to the conjecture that the Teut. √ *gai* stands for **ga-i*, being the generalizing prefix, Goth. *ga-*, AS., etc., *ge-* (see *y-*), + √ *i*, go. The AS. pres. ind. 1 *gā*, 2 *gāst*, 3 *gāth* = Goth. as if 1 **ga-im*, 2 **ga-is*, 3 **ga-ith*, equiv. to the simple forms 1 **im*, 2 **is*, 3 **ith* (disused perhaps because of possible confusion with similar forms of the verb *be*, namely, 1 *im*, 2 *is*, 3 *ist* = E. 1 *am*, 2 *art*, 3 *is*); = L. *vo* (pres. ind. 1 *eo*, 2 *is*, 3 *it*) = Gr. *ἴεναι* (pres. ind. 1 *εἶμι*, 2 *εἶ*, *εἶς*, 3 *εἶσι*) = Skt. √ *i* (pres. ind. 1 *emi*, 2 *eshi*, 3 *eti*, etc.) = Lith. *eiti* = OBulg. *iti*, go. In this view, the pret., AS. *ēode*, Goth. *iddja*, etc. (in comp. *ge-ēode*, ME. *geode*, *gede*, *gode*, E. obs. *yede*, *yode*, with occas. pres. *yede*, *yead*), appar. from a different root, is formed from the same root **i*, without the prefix.] **I.** *intrans.* 1. The nearest wild relative of the goat is the ibex. The so-called Rocky Mountain goat belongs to a different group (see below). The name *goat* is often extended to some goat-like antelopes, as the dzeren. The male of the goat is called a *buck*, and the young a *kid*. The sexes are distinguished as *he-goats* and *she-goats*, or colloquially as *billy-goats* and *nanny-goats*.

Whether the Gr. *χρυσός*, gold, is cognate is doubtful; the L. word is different: see *aurum*. Hence *gild*[1], *gilt*[1], *gilden*[1], and ult. *gilden*[2], *gulden*.] **I.** *n.* 1. Chemical symbol, Au; atomic weight, 197.3. A precious metal remarkable on account of its unique and beautiful yellow color, luster, high specific gravity, and freedom from liability to rust or tarnish when exposed to the air. The specific gravity of pure gold is 19.3. Gold stands first among the metals in point of ductility and malleability. Its tenacity is almost equal to that of silver, two thirds that of copper, and twelve times that of lead. It may be beaten into leaves thin enough to transmit a greenish light. It stands next to silver and copper as a conductor of heat and electricity; its melting-point is about 1,100° C. (or 2,000° F.); it is not attacked by any of the ordinary acids, but combines readily with chlorin; and it is dissolved by a mixture of hydrochloric and nitric acids. The crystalline form of gold is isometric, but crystallized gold is a rarity, and it is extremely uncommon to find crystals with smooth faces and sharp edges. Neither have any very large crystals ever been noticed, nor one so much as an inch in diameter. Arborescent masses, showing irregularly developed crystalline planes, are occasionally found, and such forms are sometimes aggregated into large masses; but much the larger part of the native gold found is entirely destitute of any appearance of crystallization, being usually in the form of small scales, which are often so minute as to be almost invisible to the naked eye. Larger rounded masses, called *nuggets*, are occasionally met with, and these are sometimes many pounds in weight. A specimen from the Ural preserved in the collection of the mining school at St. Petersburg weighs nearly a hundred pounds. The largest nugget of which there is any record was found in Australia, and was called the "Welcome." It weighed over 184 pounds, contained by assay 99.2 per cent. of gold, and netted a value when melted of $46,625. Gold is a widely disseminated metal, but does not occur anywhere in large quantities, as compared with the ordinary useful metals. There is no proper ore of gold, this metal being never, so far as known, mineralized by sulphur or oxygen. Although gold is disseminated in fine and usually invisible particles through various ores of the other metals, and in many cases in quantity great enough to be separated with profit, most of the gold of the world is obtained either in the form of native gold, from washing the superficial detritus (sand and gravel), or by separating it from quarts, with which mineral it is almost invariably associated when occurring in veins or segregations in the solid rocks. Native gold is, however, in fact, an alloy of gold with silver, and traces of copper and iron are often associated with it. No native gold entirely free from silver has ever been found. The amount of the latter metal present in the gold varies greatly in different regions. The gold of California usually contains from 10 to 12 per cent. of silver; that of Australia rather less than half as much. The native gold of Mount Morgan, Queensland, approaches more nearly to chemical purity than any hitherto discovered, since it contains 99.7 per cent. of gold, and only a minute trace of silver. Pure gold is very rarely used in the arts. All gold coin and gold ornaments in use are alloys of gold with copper, or with copper and silver. The alloy is used, in the case of coin, because pure gold is too soft to bear rough usage; and for the same reason, as well as to diminish the cost, in the case of gold used for personal ornaments. The coin of England is composed of 11 parts of gold and 1 of copper; that of France and the United States of 9 of gold and 1 of copper. The so-called gold used for jewels and watch-cases varies from 8 or 9 to 18 carats fine. (See *carat*, 3.) The alloys of gold with copper and silver are given various shades of color by treatment with chemicals, according to fashion or fancy. Gold has been in use for ornamental purposes from the earliest times. The world's output of gold during recent years, according to the reports of the United States mint, has been as follows: 1890, $118,840,000; 1891, $130,650,000; 1892, $146,297,000; 1893, $157,228,000; 1894, $181,510,000; 1895, $200,288,000; 1896, $202,082,300; 1897, $237,504,800. In the United States the output has increased from over $33,000,000 in 1890 to $46,610,000 in 1895 and $57,363,000 in 1897. The total amount of gold coin in circulation in the United States at the end of 1898 is estimated as about $625,000,000. See *gold-standard*.

gonidium (gō-nid'i-um), *n.*; pl. *gonidia* (-ą). [NL., < Gr. *γονή*, generation, seed, + dim. term. *-ιδιον.*] 1. In *algol.*, a reproductive body produced asexually, as a tetraspore or zoöspore. By some authors the term is made to include also the asexual reproductive bodies of fungi and other cryptogams, being in this sense synonymous with *conidium*.

2. In *bryol.*, a cell filled with granules. *Braithwaite.*—3. One of the green or chlorophyl-bearing elements of lichens, usually occurring in the thalli in a distinct layer, but sometimes not definitely arranged. They are usually variously rounded cells, distinct or in chains or filaments, and multiply by fission. They were formerly supposed to be produced by the hyphæ of the thallus at their tips; but some recent observers hold that they are formed endogenously in all parts of the lichen and its fruit; others believe that they originate entirely outside and independently of the lichen. The various forms of gonidia are found to resemble closely various forms of fresh-water algæ. The Schwendenerian hypothesis asserts that the gonidia are algæ, and that the fungoid part of the lichen is a fungus parasitic upon them. Several forms have been named, as follows: (*a*) *Eugonidia*, or gonidia proper, those having a pure chlorophyl-green color. They are subdivided into (1) *haplogonidia*, resembling *Protococcus*; (2) *platygonidia*, depressed and variously membranously connected gonidia; (3) *chrolepogonidia* or *chrysogonidia*, which contain orange granules; (4) *confervogonidia*, resembling *Confervæ*. (*b*) *Gonidimia*, smaller than gonidia proper, and intermediate between them and gonimia. They include hymenial gonidia. (*c*) *Gonimia*, which are glaucous-green or bluish. They include varieties named and characterized as follows: (1) *haplogonimia*, large, simple, or in small groups; (2) *stirogonimia*, which are scytonemoid or sirosiphonoid, tunicated, and are characteristic of *Ephebaceæ*; (3) *hormogonimia*, the commonest form, which are smaller, in moniliform chains, are contained in syngonimia, and occur in *Collemaceæ*; (4) *spirogonimia*, like the preceding, but not moniliform, and in globose syngonimia. Also called *chromidium*.

The primordial cell should be referable either to hyphæ or *gonidium*. *E. Tuckerman*, N. A. Lichens, Int.

But after this confusion and the non-reproductive character of Wallroth's *gonidia* had long been recognised, the expression was still retained in an altered sense for the Algæ of the Lichen-thallus, and with it the terms gonidial layer or gonimic layer (stratum gonimion), hymenial *gonidia*, and others of the same kind.

planes, particularly the angles formed by the faces of crystals. A *contact-* or *hand-goniometer* consists of a graduated circle or half-circle, with two arms movable about a center, and either attached or free. The edges of these arms are brought in close contact with the two surfaces, and the angle is then read off on the graduated arc. A *reflecting goniometer* consists of a graduated circle supported in either a vertical or a horizontal position upon a stand, and provided, first, with a more or less elaborate arrangement for adjusting and centering the crystal to be measured, so that the intersection edge shall be exactly in the axis of rotation of the circle, and, second, with one or (better) two telescopes; in the latter case one serves to project a signal, as a hair cross, upon the surface to be measured, and the other to observe this signal as reflected. The angle through which the graduated circle—that is, the crystal—must be revolved to make the signal visible, first from one plane and then from the other, is the supplement of the true internal angle between the two faces. A *contact-lever goniometer* is provided with a graduated circle, like the last form, but a point connected with a delicate lever-system takes the place of the telescopes and eye to fix the position first of one and then of the other plane.

Ir. *gosa* is of E. origin. The *-s* seems to be merely formative, the stem *gau-* appearing in the related words *gander* and *gannet*, q. v. As to the use of *goose* for a tailors' smoothing-iron, cf. G. *gans*, a lump of melted iron, the term being used like the equiv. E. *pig* and *sow*; the equiv. F. *queuse* (whence appar. Sw. *gös*, or perhaps < Sw. *gös*?) is a different word. Ill-judged attempts have been made to derive *goose*, in the sense of 'a silly person,' from another source, on the ground that the popular notion as to the stupidity of the bird is erroneous, "it being only ignorance of the darkest hue that ventures to portray the goose as deficient in sagacity or intelligence" (Cornhill Mag., VIII. 203); but popular notions are often based on ignorance. Hence *gooseling, gosling, goshawk*.] 1. Any bird of the family *Anatidæ* and subfamily *Anserinæ*, of which there are about 40 species of several genera, as well as different varieties of the domesticated bird. See phrases below. Geese are technically distinguished from swans and from ducks by the combination of feathered lores, reticulate tarsi, stout bill high at the base, and simple hind toe. The neck is shorter than in swans, and usually longer than in ducks; the sexes are usually similar, contrary to the rule among ducks. Geese stand higher and walk better than ducks; as a rule they are less decidedly aquatic and more herbivorous, the cæca being more highly developed in consequence. Geese have a peculiar cry or call known as *honking*, and also utter a hissing sound. The flesh of most geese is highly esteemed. The tame goose in all its varieties is supposed to be descended from the graylag or common wild goose of Europe, *A. ferus*; but some other related species may have contributed to the domestic stock. The pure-white variety is entirely artificial, and not related to the snow-geese of the genus *Chen*. The male of the goose is called *gander*, and the young of either sex *gosling*.

4. A game of chance formerly common in England. It was played on a card divided into small compartments numbered from 1 to 62, arranged in a spiral figure

around a central open space, on which, at the beginning of the game, the stakes were laid, and during the game any forfeits paid. It was played by two or more persons with two dice, and the numbers that turned up to each designated the number of the compartment by which he might advance his mark or counter. It was called the game *of goose* because at every fourth and fifth compartment in succession a goose was depicted on the card, and, if the throw of the dice carried the counter of the player on a goose, he might move forward double the actual number thrown. *Strutt*

C. by Hanno, a Carthaginian navigator, as the native name of a wild creature found on those coasts. The account, written orig. in the Punic language and translated into Greek, says that the voyagers found an island, in a lake near a bay called the "Southern Horn," "full of wild people (*ἀνθρώπων ἀγρίων*), the greater part of whom were females (*γυναῖκες*, women), hairy on their bodies, whom our interpreters called *Gorillas* (Γορίλλας). We pursued them, but could not capture the males (*ἄνδρας*, men); they all escaped, climbing the cliffs and hiding among the rocks; but we captured three females (*γυναῖκας*), who, biting and scratching their captors, refused to go along with them. We killed and skinned them and brought the skins to Carthage." (Periplus, xviii., in *Geographi Græci Minores*, ed. C. Müller, I. 13, 14.) These creatures, apparently not regarded by the Carthaginians as human beings, though spoken of in such terms, are supposed to have been apes, probably chimpanzees.] 1. The largest known anthropoid ape, *Troglodytes*

Gorilla (*Troglodytes gorilla* or *Gorilla savagei*)

gorilla, of the family *Simiidæ*, suborder *Anthropoidea*, and order *Primates*, most closely resembling man, especially in the form of the pelvis

and in the proportion of the molar teeth to the incisors. It has 13 ribs. The tail is even more rudimentary than in man, having but 3 coccygeal bones instead of 4. The gorilla is also called the *great chimpanzee*, and is a near relative of the chimpanzee, *Troglodytes niger* or *Anthropopithecus niger*. It attains a height of about 5½ feet, is found in the woody equatorial regions of Africa, is possessed of great strength, has a barking voice, rising when the animal is enraged to a terrific roar, lives mostly in trees, and feeds on vegetable substances. Gorillas make a sleeping-place like a hammock, connecting the branches of the sheltered and thickly leafed part of a tree by means of the long, tough, slender stems of parasitic plants, and lining it with the broad dried fronds of palms or with long grass. This hammock-like abode is constructed at different heights from 10 to 40 feet from the ground, but there is never more than one such nest in a tree. The animal was unknown to Europeans, except from vague report, until it was described in 1847 by Dr. T. S. Savage, an American missionary in western Africa. The first skeletons of the gorilla seen in Europe were brought by the American traveler Du Chaillu in 1860. The living specimens since brought to Europe and America have soon died.

2. The story of Christ's life, teachings, sufferings, death, resurrection, and ascension; hence, one of the books in which that story was originally told: as, the *Gospel* of Matthew. [Preferably with a capital letter when used in a titular sense, but not in the general senses.]

The gospels are four in number—those of Matthew, Mark, Luke, and John. Of these four, those of Matthew and John were written by apostles and eye-witnesses, that of Luke is avowedly gathered from others who were wit-

senses, and that of Mark has been from a very early age believed to be written by a disciple of the apostle Peter. The first three gospels are known as the *synoptic gospels*, because combined they present a general and harmonized view of Christ's life. The Johannine origin of the fourth has been much disputed. Matthew and Mark confine themselves chiefly to Christ's ministry in Galilee; Luke adds an account of his ministry in Perea; John alone records his ministry in Judea, except that portion of it connected with the Passion. There are also apocryphal gospels which are not regarded as genuine by any scholars, either Protestant, Roman Catholic, or Greek. The more important of these are: the *Gospel of the Birth of Mary*, an account of Mary's birth, youth, and espousals; the *Pro-evangelion*, a somewhat similar account; the *Gospels I. and II. of the Infancy of Jesus Christ*; and the *Gospel of Nicodemus*, also called the *Acts of Pontius Pilate*, being an account of the crucifixion of Christ and his experiences in Hades.

Hence — **4.** Any doctrine, religious or secular, maintained as of great or exclusive importance.

5. A portion of Scripture taken from one of the four gospels, and appointed to be read in liturgical churches as a part of the church service. The gospel is the last and principal of the two or more eucharistic lections in all liturgies. In the Western churches the portions are selected with reference to their appropriateness to the day or season; in the Eastern they are read in consecutive order except on special festivals. In ancient times the gospel was read in the West, as in the East, from the ambo, sometimes from a distinct ambo of its own, later from a desk on an elevated place between nave and choir, called the "pulpit" (*pulpitum*), which developed, as it was made more and more lofty, into the rood-loft or jube. In later times it was read from a lectern on the floor of the sanctuary, or from the north side of the altar — that is, from that part of the front of the altar which is at the right hand of the altar crucifix, or of the priest, if he stands in the middle and faces the people. The north side is therefore called the *gospel side* of the altar, and in Latin this side, or, more strictly, the corner beyond it, is termed *cornu Evangelii*, the horn of the gospel, or *gospel horn* of the altar. In the Anglican Church the deacon, or person who acts as deacon, at the celebration of the holy communion, is called the *gospeler*, from his function of reading the gospel. The custom of delivering a book of the gospels to a deacon at his ordination originated in England, and afterward became a usage in the whole of the Western Church.

Four species are generally recognised, though many others have been proposed. The cultivated species are natives of Asia and Africa, where they have been planted from very early times, and many varieties have been produced. All the cotton manufactured in civilised countries is the product of several varieties of *G. herbaceum* and *G. Barbadense*, but *G. arboreum* is also cultivated in some tropical regions. One of an ancient Teutonic race which appeared in the regions of the lower Danube in the third century A. D. A probable hypothesis identifies them with the Gothones or Guttones who dwelt near the Baltic; but there is little reason to believe in their relationship with the Getæ or in their Scandinavian origin. They made many inroads into different parts of the Roman empire in the third and fourth centuries, and gradually accepted the Arian form of Christianity. The two great historical divisions were the Visigoths (West Goths) and the Ostrogoths (East Goths). A body of Visigoths settled in the province of Mœsia (the present Servia and Bulgaria), and were hence called Mœsogoths; and their apostle Wulfila (Ulfilas) translated the Scriptures into Gothic. The Visigoths formed a monarchy about 418, which existed in southern France until 507 and in Spain until 711. An Ostrogothic kingdom existed in Italy and neighboring regions from 493 to 555. By extension the name was applied to various other tribes which invaded the Roman empire.

3. An epithet commonly applied to the European art of the middle ages, and more particularly to the various Pointed types of architecture generally prevalent from the middle of the twelfth century to the revival of study of classical models in the fifteenth and sixteenth centuries. This epithet was originally applied in scorn (compare def. 2), by Italian Renaissance architects, to every species of art which had existed from the decay of Roman art until the outward forms of that art were revived as patterns for imitation; but, although no longer used in a depreciative sense, the adjective is inappropriate as applied to one of the noblest and completest styles of architecture ever developed, which owes nothing whatsoever to the Goths, and is seldom now described as Gothic in other languages than English. See *mediæval* and *Pointed*.

The roof had some non-descript kind of projections called bartisans, and displayed at each frequent angle a small turret, rather resembling a pepper-box than a *Gothic* watch-tower. *Scott*, Waverley, viii.

4. In *liturgics*, an epithet sometimes applied to the Mozarabic liturgy, or to the Gallican family of liturgies, in accordance with an incorrect theory that they were first introduced into Gaul and Spain by the Visigoths, or from the fact that they were in use in Gallican and Spanish churches at the time of Gothic domination. An ancient manuscript of the Gallican liturgy still extant is entitled a *Gothic Missal* (*Missale Gothicum*) by a later hand.

II. *n.* 1. The language of the Goths. The Goths spoke various forms of a Teutonic tongue now usually classed with the Scandinavian as the eastern branch of the Teutonic family, though it has also close affinities with the western branch (Old High German, Anglo-Saxon, etc.). All forms of Gothic have perished without record, except that spoken by some of the western Goths (Visigoths), who at the beginning of the fourth century occupied Dacia (Wallachia, etc.), and who before the end of that century passed over in great numbers into Mœsia (now Bulgaria, etc.). Revolting against the Roman empire, they extended their conquests even into Gaul and Spain. Their language, now called *Mœsogothic* or simply *Gothic*, is preserved in the fragmentary remains of a nearly complete translation of the Bible made by their bishop, Wulfila (a name also used in the forms *Ulfila*, *Ulphila*, *Ulfilas*) (who lived in the fourth century A. D.), and in some other fragments. These remains are of the highest philological importance, preceding by several centuries the next earliest Teutonic records (Anglo-Saxon and Old High German). The language bears a primitive aspect, indicating its existence under practically undisturbed linguistic conditions for a long period before its appearance in the records. Apart from the Latin and Greek words introduced with Christianity, Gothic shows little trace of foreign influence except in the presence of a few words borrowed from the neighboring Slavs. As the oldest recorded Teutonic tongue, and usually but not always nearest the original Teutonic type, it stands at the head of the languages of its class, to which it bears a relation like that of the Sanskrit to the other languages of the Indo-European family.

In *gram.*, to cause or require to be in a particular form: as, a transitive verb or a preposition *governs* a noun or pronoun in the objective case; the possessive case is *governed* by the thing possessed; the subject *governs* the verb in number and person.=**Syn.** 1 and 2. *Rule*, *Control*, *Govern*, *Regulate*, *Manage*; conduct, supervise, guide; command, sway, curb, moderate. Of the first five words, *rule* is the most general, and is the only one that can stand for the exercise of an arbitrary or a loose kind of sway. *Control* implies a firm *rule*, which may not attend to the details of administration, but holds persons in check and prevents things from going in a way not desired: as, to *control* expenditures; to *control* fierce tribes. *Govern* implies the constant use of knowledge and judgment, like the close attention given by a pilot to his wheel. To *regulate* is to bring under rules, hence to make exact; it is not ordinarily used to express continued action, but it may mean to keep under rule: as, to *regulate* a watch, one's movements, one's conduct, the administration of a province. *Manage* enlarges the notion of handling a horse or caring for the affairs of a household to greater things, as a ship, a business, a nation; it implies great attention to details, constant watchfulness, and much skill or at least adroitness; it is rather a small word to be used as a synonym for *govern*. See *guide*, *v. t.*, and *manage*.

5. A father; a master or superior; an employer; an elderly person. [Slang.] — 6. In *mach.*, a self-acting regulator which controls a supply of steam, gas, or water; especially, any device for automatically regulating the amount of power developed in a machine, as in a steam-engine. Governors are made in a variety of forms and with different methods of action. A form of governor for the steam-engine which illustrates well the general function of such devices is shown in the annexed figure. It represents a spindle kept in motion by the engine. *A* and *B* are two centrifugal balls, *C A* and *C B* the rods which suspend the balls, crossing each other and passing through the spindle at *C*, where the whole is connected by a round pin put through the spindle and the rods, and serving as the point of suspension for the centrifugal balls or revolving pendulums. A piece of brass, *M*, is fitted to slide up and down upon the upper part of the spindle, and to this piece the end of the lever *N O*, whose fulcrum is at *P*, is attached. This piece of brass is also connected with the ball-rods by two short pieces and joints, *D E*, *F G*. When the engine goes too fast, the balls fly further asunder and depress the end *N* of the lever, which partly shuts a throttle valve connected with the end *O*, and thus diminishes the quantity of steam admitted into the cylinder; and on the other hand, when the engine goes too slowly, the balls fall down toward the spindle and elevate the end *N* of the lever, which opens the throttle valve wider, and increases the quantity of steam admitted into the cylinder, thus causing it to be proportioned to the resistance of the engine, and keeping the variation of velocity within narrow limits. A similar contrivance is employed in mills to equalize the motion of the machinery. When any part of the machinery is suddenly started or checked, and the moving power remains the same, an alteration in the velocity of the mill will take place, which alteration the governor serves to limit. See *gas-governor*. — **Atmospheric, chronometric, etc., governor.** See the adjectives. — **Electric governor**, in *mach.*: (*a*) A governor in which the spread of revolving balls or the spread of the rim of a wheel by centrifu-

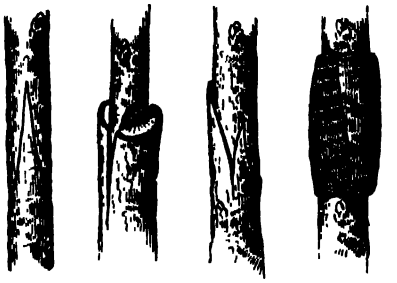
I am informed by trials of the most skilful *grafters* of these parts, that a man shall seldom fail of having cherries borne by his graft the same year. *Evelyn.*

2. A saw designed especially for sawing off limbs and stocks preparatory to grafting. It has a narrow pointed blade and fine teeth.

graft-hybrid (gràft'hī'brid), *n.* See the extracts and *hybrid*.



It would appear that the two distinct species mentioned above [*C. purpureus*, Scop., and *C. Laburnum*, L.] became united by their cambium layers, and the trees propagated therefrom subsequently reverted to their respective parentages in bearing both yellow and purple flowers, but produce as well blossoms of an intermediate or hybrid character. Such a result, Mr. Darwin observes, may be called a *graft-hybrid*. *Encyc. Brit.*, XIV. 179.

grafting (gràf'ting), *n.* [Verbal n. of *graft*[2], *v.*] 1. The methods of grafting are of great variety, designated by the words *whip*, *splice*, *cleft*, *saddle*, *crown*, etc. In *whip-grafting*, or *tongue-grafting*, the stock and scion, of

Saddle-grafting. Cleft-grafting. Whip-grafting.

equal size, are fitted together by tongues cut in each, and tightly bound (whipped or lashed) until they are well united in growth. *Splice-grafting* is performed by cutting the ends of the scion and stock completely across in an oblique direction, in such a way that the sections are of the same shape, then laying the oblique surfaces together so that the one exactly fits the other, and securing them by tying or otherwise. In *cleft-grafting* the stock is cleft down, and the graft, cut in the shape of a wedge at its lower end, is inserted into the cleft. In *saddle-grafting* the end of the stock is cut in the form of a wedge, and the base of the scion, slit up or cleft for the purpose, is affixed. *Crown-grafting*, or *rind-grafting*, is performed by cutting the lower end of the scion in a sloping direction, while the head of the stock is cut over horizontally and a slit is made through the inner bark; a piece of wood, bone, ivory, or other such substance, resembling the thinned end of the scion, is inserted in the top of the slit between the alburnum and the inner bark and pushed down in order to raise the bark, so that the thin end of the scion may be introduced without being bruised, the edges of the bark on each side are then brought close to the scion, and the whole is bound with matting and clayed.

By Joseph, according to one account, it was carried to Britain. Other accounts affirm that it was brought by angels from heaven and intrusted to a body of knights, who guarded it on the top of a mountain; when approached by any one not perfectly pure it vanished from sight. The grail having been lost, it became the great object of search or quest to knights errant of all nations, none being qualified to discover it but a knight perfectly chaste in thought and act. The stories and poems concerning Arthur and the Knights of the Round Table are founded on this legend, and it has been still further developed in modern times. See *sangreal*.

The ounce of each therefore contains 480 grains, while in avoirdupois weight, in which the grain is not used, the ounce is equal to 437½ grains and the pound to 7,000 grains. Abbreviated *gr.*

waders, including forms now dispersed in several orders.—2. In Merrem's classification, the larger and chiefly altricial grallatorial birds, such as herons, ibises, storks, and spoonbills, and also præcocial forms, such as the cranes.—3. An ordinal or other group of wading birds, variously restricted. The term has been transmitted from a former stage of ornithology, and no one has succeeded in defining it with precision. It is often discarded, the waders that had been placed in it being then distributed in three groups, called *Limicolæ*, the præcocial shore-birds; *Herodiones*, the altricial waders, as herons, storks, and ibises; and *Alectorides* or *Paludicolæ*, the præcocial wading birds, like cranes, rails, and their allies. When the name *Gralla* is retained, it usually covers the first and third of these groups, and may be briefly said to correspond to the præcocial wading birds. These

are an extensive and varied series of about 20 families. The plovers, *Charadriidæ*, and the snipes, *Scolopacidæ*, are the largest of these families; and more or less nearly related to these schizorhinal charadriomorphs are the *Chionididæ*, or sheathbills, the *Thinocoridæ*, or lark-plovers; the *Glareolidæ*, or pratincoles; the *Dromadidæ*, or crab-plovers; the *Hæmatopodidæ*, or oyster-catchers; the *Jacanidæ* or *Parridæ*, the jaçanas; the *Recurvirostridæ*, or avosets and stilts, and the *Phalaropodidæ*, or phalaropes. A pair of holorhinal families of *Grallæ* are the *Œdicnemidæ*, or thick knees, and the *Otididæ*, or bustards. The remarkable gralline genera *Eurypyga*, *Rhinochetus*, and *Mesites* are types respectively of three families. The remaining precocial gralline families are the *Gruidæ* and *Rallidæ*, or cranes and rails, with which are now associated the *Aramidæ*, *Psophiidæ*, and *Cariamidæ*. See the family names.

grammar (gram'ėr), *n.* [Early mod. E. also *grammer*; < ME. *grammere*, usually with one *m*, *gramer*, *gramere*, *gramour*, sometimes *gramary*, *gramery*, *gramory*, < OF. *gramaire*, later and mod. F. *grammaire*, f., grammar (cf. *gramaire*, m., a grammarian), = Pr. *gramatra*, *gramairia*, a popular form based on a ML. type **grammaria*, f., not found, the proper L. and ML. form being *grammatica*, *grammatice* (> It. Pg. *grammatica* = Sp. *gramática* = OF. *gramatique*), < Gr. *γραμματική* (sc. *τέχνη*, art), grammar, learning, criticism, fem. of *γραμματικός*, pertaining to or versed in letters or learning, < *γράμμα*, that which is drawn or written, a letter, writing, pl. *γράμματα*, the letters, the alphabet, the rudiments, in writing, letters, learning, < *γράφειν*, draw, write: see *gram*², *graphic*, *grave*¹. Under the term *grammar* were formerly included, more or less vaguely, almost all branches of learning, as based on the study of language; and from this sense of 'learning' it came to imply profound or occult learning, and hence 'magic, enchantment,' in which sense the word is found in the variant forms *gramary*, *gramery*, etc., and *glamery*, *glamer*, *glamour*, etc.: see *gramary* and *glamour*. See also *glomery*, another var., in the lit. sense.] 1. A systematic account of the usages of a language, as regards especially the parts of speech it distinguishes, the forms and uses of inflected words, and the combinations of words into sentences; hence, also, a similar account of a group of languages, or of all languages or language in general, so far as these admit a common treatment. The formerly current classification of the subjects of grammar as fivefold, namely, *orthography*, *orthoëpy*, *etymology*, *syntax*, and *prosody*, is heterogeneous and obsolescent. The first and last do not belong really to grammar, though often for convenience included in the text-books of grammar; *orthoëpy* is properly phonology or phonetics, an account of the system of sounds used by a language and of their combinations; and *etymology* is improperly used for an account of the parts of speech and their inflections. See these words. Abbreviated *gram.*

Women are admitted to membership.

S., 113, 155, 165, 179, 180, 181), the principal ones being Munn *vs.* Illinois, and Chicago, Burlington, and Quincy Railroad Co. *vs.* Iowa: so called because they grew out of certain State statutes passed in the interest of the grangers, regulating grain elevator tolls and the charges of warehousemen and common carriers. The court sustained the constitutionality of these statutes, affirming the common-law doctrine that when private property is devoted to a public use it is subject to public regulation, and holding that this right is not affected by the fourteenth amendment to the United States Constitution, which ordains that no State shall "deprive any person of life, liberty, or property without due process of law."

Cf. *granate*, *garnet*[1], and *pomegranate*.] 1. A rock composed of orthoclase-feldspar, mica, and quartz, and having a thoroughly crystalline-granular texture. While orthoclase is an essential constituent of true granite, triclinic feldspars are often present in smaller quantity. The mica is sometimes white or silvery (muscovite), and sometimes dark-brown or even black (biotite). Both varieties are occasionally present together, and some lithologists call only that variety true granite in which both are present. While granite is a thoroughly crystalline rock, distinctly formed crystals of the component minerals are rarely seen in it, except on the walls of cavities. The color of granite is somewhat varied, although in much the larger number of cases the predominating tint is a light gray; some varieties, however, are almost as white as white marble; others are of a light-red or a pink color, which tint is due to the predominance of a rose-colored feldspar. Some varieties of granite are very massive and homogeneous in texture; hence this rock can often be quarried in blocks of large size. Granite is much used for building purposes where massiveness and durability are the chief requisites. It resists very poorly, however, the action of fire, flaking off and crumbling under the influence of heat. Many varieties take a fine polish, and are used for interior decoration and for monumental work. Its hardness and coarseness of texture make it unfit for statuary. The theory of the origin of granite, and its relations to the distinctly eruptive lavas on the one hand and the distinctly stratified rocks on the other, have long been subjects of discussion among geologists. Granite has often been called a "Plutonic" rock, to express the idea generally held by geologists that it has become consolidated at considerable depth below the surface, not having been poured out of a volcanic orifice like lava. Among the rocks ordinarily designated as *granite* by quarrymen and others there are many varieties, with a correspondingly varied scientific nomenclature. Of these varieties and names the following are the more important: *pegmatite*, which includes the granites in which the component materials are present in crystalline masses of large dimensions; *porphyritic granite*, a variety with distinct crystals of feldspar scattered through a fine-grained material; *graphic granite*, in which the quarts has assumed forms somewhat resembling Hebrew characters; *syenite*, *syenitic granite*, *hornblende granite*, or *amphibole granite*, a rock in which hornblende occurs in addition to the other normal constituents of granite, the most famous locality of which variety is Syene, in upper Egypt, from which the name is derived (see *syenite* for the more modern application of this name); *granitite*, a granite in which only a dark-colored variety of mica occurs; *granulite*, a fine-grained granite with red garnets; and *greisen*, a granitic rock nearly or quite destitute of feldspar, interesting from its frequent association with valuable minerals and metalliferous ores, especially those of tin. See *granitite*, *granulite*, *pegmatite*, and *greisen* for fuller definitions of these words.

2. The vine which produces this fruit; the grape-vine. The cultivated grape of Europe, whether it be for wine or for table use, is the *Vitis vinifera,* of which there are said to be 1,500 varieties. The more common native species of the United States are the chicken, frost, or winter grape, *V. cordifolia,* the fruit of which is small, very sour, and worthless; the riverside grape, *V. riparia;* the northern fox or plum grape, *V. Labrusca;* the southern fox, bullace, muscadine, or scuppernong grape, *V. vulpina* or *rotundifolia;* and the summer grape, *V. æstivalis.* The numerous cultivated table-grapes of the eastern United States are either varieties of these (as the Concord, Catawba, Isabella, Hartford Prolific, etc., derived from *V. Labrusca,* and the Clinton, from *V. riparia*), or hybrids of these with each other or with varieties of *V. vinifera* (as the Delaware, Niagara, Taylor, etc.). The most successful wine-grapes are for the most part varieties of *V. æstivalis.* All the purely American varieties are remarkable for their power of resisting the attacks of the phylloxera or grape-louse, which has proved so fatal to the European vine, and on this account they have been of late years extensively introduced into the vineyards of Europe. *V. riparia* has been very largely used for this purpose, either taking the place of *V. vinifera* entirely or furnishing stocks upon which that species may be safely grafted. See cut under *Vitis.*

grape-mildew (grāp′mil′dū), *n.* A fungous disease of the grape. The American or downy mildew is *Peronospora viticola,* which appears in white, downy patches, chiefly on the under surface of the leaves, producing brown spots on the opposite surface. It also occurs on young stems and fruit. The fructification of the fungus consists of conidia borne upon sparingly branched pinnate conidiophores, and oöspores embedded in the leaf. (See cut under *conidium.*) It has been very destructive in North America, and more recently in southern Europe. The old European grape-mildew is *Oïdium Tuckeri,* in which only the conidial fructification is known, the conidia being borne in a single chain on simple conidiophores. The powdery grape-mildew of America is *Uncinula spiralis,* one of the *Erysipheæ* in which the mycelium is spread over the whole upper surface of the leaf, but does not enter its tissues, and the fructification consists of minute cleistocarpous conceptacles containing asci and spores.

grape-rot (grāp′rot), *n.* Any disease of grapes which results in the decay of the berry. The black-rot fungus is *Phoma uvicola,* which causes the grapes to shrivel and turn blackish. It forms numerous pustules just beneath the surface, which are conceptacles containing spores. In America this is the most destructive rot. The white rot is caused by *Coniothyrium diplodiella.* When *Peronospora viticola* attacks the berries, the resulting decay has been called brown rot. A recently discovered fungus (*Greeneria fuliginea*) is said to produce bitter rot.

Graphical methods are of three kinds: those which make no use of the continuity of space except to show that the extremities of lines are connected, and of this kind are graphs; those which use only the projective properties of space; and those which use the metrical properties of space, and which produce diagrams intended to be measured. Sw. *gravitation* = F. *gravitation* = Sp. *gravitacion* = Pg. *gravitação* = It. *gravitazione*, < NL. **gravitatio(n-)*, < **gravitare*, gravitate: see *gravitate*.] 1. The act of gravitating or tending toward a center of attraction.—2. That attraction between bodies, or that acceleration of one toward another, of which the fall of heavy bodies to the earth is an instance. See *gravity*, 1. Gravitation can be neither produced nor destroyed; it acts equally between all pairs of bodies, the force being directly proportional to the product of their masses and inversely as the distance between their centers of gravity; it is neither hindered nor strengthened by any intervening medium; it occupies no time in its transmission; and the amount of it is such that a particle distant one centimeter from an attracting gram of matter would by the action of gravitation alone, were no other force present, fall into the center of attraction in 40 minutes and 20 seconds. Inasmuch as the masses of bodies can be measured otherwise than by their weights, namely, by their relative momentums under a given velocity, it follows that the *modulus of gravitation*, or the amount by which the unit mass attracts a particle at the unit distance, which is invariable, best distinguishes gravitation from every other force. The laws of the attraction of gravitation were demonstrated by Sir Isaac Newton in 1687.

The most considerable phænomenon belonging to terrestrial bodies is the general action of *gravitation*, whereby all known bodies in the vicinity of the Earth do tend and press towards its centre. *Bentley*, Sermons, vii.

gravitationally (grav-i-tā'shọn-ạl-i), *adv.* By gravitation, or in the manner of gravitation.

gravity (grav'i-ti), *n.*; pl. *gravities* (-tiz). [= G. *gravität* = Dan. Sw. *gravitet*, < F. *gravité* = Sp. *gravidad*, *gravedad* = Pg. *gravidade* = It. *gravità*, < L. *gravita(t-)s*, weight, heaviness, pressure, < *gravis*, heavy: see *grave*[3].] 1. Weight, as contradistinguished from mass; precisely, the downward acceleration of terrestrial bodies, due to the gravitation of the earth modified by the centrifugal force due to its rotation on its axis. The amount of this acceleration is about 385.1 inches (978 centimeters) per second at the sea-level and the equator, while at the poles it is 387.1 inches. Gravity is a little less on mountains than at the sea-level, in the proportion of a diminution of one thousandth part at every two miles of elevation. There are also other slight variations of gravity, from which the figure of the geoid (which see) can be calculated. Generally speaking, gravity is in excess where the radius vector of the geoid is in excess of that of the mean spheroid. [The words *gravity* and *gravitation* have been more or less confounded; but the most careful writers use *gravitation* for the attracting force, and *gravity* for the terrestrial phenomenon of weight or downward acceleration which has for its two components the gravitation and the centrifugal force. The centrifugal force at the equator is $\frac{1}{289}$ of gravity. It is everywhere exerted in the plane of the meridian at right angles to the direction of the celestial pole. The direction of gravitation in middle latitudes is inclined about 11'.5 to the radius of the earth.

None need a guide, by sure attraction led,
And strong impulsive *gravity* of head.
Pope, Dunciad, iv. 76.]

2. Solemnity of deportment or character; sedateness of demeanor; seriousness.

4. In *acoustics*, the state of being low in pitch: opposed to *acuteness*.—**Acceleration of gravity.** See *acceleration* (*b*).—**Center of gravity.** See *center*[1].—**Gravity cell**, or **gravity battery**, in *elect*. See *cell*, 8.—**Line of direction of gravity**, the line drawn through the center of gravity of a body in the direction in which gravity tends to move it; the line along which the center of gravity would begin to fall if the body were free.—**Specific gravity**, the ratio of the weight of a given bulk of any substance to that of a standard substance. The substance taken as the standard is water for solids and liquids, air or hydrogen for gases. The weights of bodies being proportional to their masses, it follows that the specific gravity of a body is equivalent to its relative density, and the term *density* has nearly displaced *specific gravity* in scientific works. As long as the term *specific gravity* was in use, water at 62° F. was taken as the standard in England; when the term *density* is used, water at its maximum density (4° C. or 39.2° F.) is the standard. If great accuracy is required, corrections must be made for temperature and for the buoyancy of the air. Thus, if we take equal bulks of water, silver, and platinum, and weigh them, the silver will be found to be 10.5 times and the platinum 21.4 times heavier than the water; and reckoning the specific gravity of water as unity, the specific gravity of silver is said to be 10.5, and that of platinum 21.4. A common method of obtaining the specific gravity of solids is to weigh the body in air, then in pure distilled water, and divide the weight in air by the loss of weight in water, the result being the specific gravity of the body. There are, however, numerous other ways of obtaining this relation, as by the use of the pycnometer, the hydrometer (which see), etc. See *gravity-solution*.

The *specific gravity* of a body is the ratio of its density to that of some standard substance, generally water.
Clerk Maxwell, Heat, p. 82.

If a number of them, each having its specific gravity marked on it, be thrown into the liquid, that one which just floats gives the required specific gravity, the others either sinking or floating.—**Specific-gravity bottle** or **flask**, a pycnometer.

gravity-railroad (grav'i-ti-rāl"rōd), *n.* A railroad in which the cars move down an inclined plane, or a series of inclined planes, under the action of gravity alone. Such roads are often arranged so that the loaded cars in descending pull a train of empty cars up to the summit; or the empty cars may be hauled up by steam-power.

gravity-solution (grav'i-ti-sō-lū"shọn), *n.* A solution used by lithologists for separating from one another the different minerals of which rocks are composed, by taking advantage of their differences of specific gravity. The method is analogous to the process of ore-dressing, which is a separation of minerals differing in specific gravity in the large way, the fluid used being water. The essential difference, however, is that the fluid used by the lithologist is varied in specific gravity, by dilution, to just the desired conditions, while the water, of course, remains always the same when used by the ore-dresser. The idea of using a gravity-solution in lithological research originated with Thoulet in 1879. The fluid which he used was a solution of the iodide of mercury in iodide of potassium, having a density of 2.77 at 57° F. Several other solutions having a higher specific gravity have since that time been used. See *specific gravity*, under *gravity*.

Also called *lime-sour*.—**Gray squirrel, whale, wolf**, etc. See the nouns.

II. *n.* 1. A gray color or tint; a color having little or no distinctive hue (chroma) and only moderate luminosity. If only about 5 per cent. of the light is reflected, the surface is called *black*; if as much as 50 per cent. is reflected, it is called *white*. Pure gray has a slightly bluish appearance, owing to contrast with the color of brightness which enters into the sensation produced by white light. A small admixture of red with gray light makes the modified gray called *ashes of roses*. A small amount of green light mixed with gray is not noticed, and if the mixture is placed in juxtaposition with pure gray, the latter looks pinkish by contrast, while the former appears of a neutral tint. A larger admixture of green will give a mouse-gray (which properly requires the green to be yellowish), a still larger amount an olive gray, and still more a sage green. The effect of the admixture of violet blue is singularly dependent upon the shade of gray; if it is quite light, the result is a lilac gray or full

lilac, or may be even too purple for lilac, while if the gray is darker a French gray or slate-gray results, which needs the addition of red to give lavender gray, although the latter appears bluer than lilac gray. If yellow is mixed with gray, the result is a stone gray or drab gray, or in larger admixture a full drab. All these remarks refer to mixtures of lights, not to mixtures of pigments, the effects of which depend upon the special absorption-spectra of the pigments, and can only be ascertained by direct experiment.

And as thou camest to me,
In homely *gray*, instead of silk and purest pall,

In ancient Greek examples the greaves were of thin metal fitted to the shape of the legs, which they inclosed almost completely, and were held in place by the elasticity of the metal clasping the leg. In medieval armor the greaves were often an additional defense, as of cuir-bouilli or of forged steel, worn over the chausse of mail or gamboised work. See *bainbery* and *jambe*, and first cut under *armor*, fig. 2. Rarely used in the singular.

grebe (grēb), *n.* [< F. *grèbe*, formerly *grebe, griaibe* (> G. dial. *grebe*), a grebe, so named, it seems, with reference to the crested species, < Bret. *krib* = Corn. and W. *crib*, a comb; cf. Bret. *kriben* = Corn. *criban* = W. *cribyn*, a crest, a tuft of feathers on a bird's head; W. *cribell*, a cock's comb.] A bird of the family *Podicipedidæ* (which see for technical characters); a diving bird, related to the loons or divers, but pinnatiped or lobe-footed, with a rudimentary tail, naked lores, and, in most species, a crest on the head. There are upward of 20 species, of several genera, distributed all over the world. They inhabit chiefly fresh waters, and are most expert divers and swimmers, but move on land very awkwardly, owing to the backward position of the legs. Because of the apparent absence of a tail, and the singular ruffs or crests, the aspect of these birds is peculiar. They nest in ponds, lakes, and rivers, generally building among reeds or rushes, and lay several, usually 6 or 8, elliptical whole-colored eggs. One of the best-known species is the common dabchick of Europe, *Podiceps* or *Sylbeocyclus minor*. The grebe known in America as the dabchick is *Podilymbus podiceps*. The largest is the spear-billed or western grebe, *Æchmophorus occidentalis*, peculiar to western North America. (See cut under *Æchmophorus*.) The great grebe is a conspicuously crested species of the old world, *Podiceps cristatus*. The European red-necked grebe is *P. griseigena*, a variety of which, *P. holboellii*, also inhabits North America. The Slavonian or horned grebe, *P. cornutus*, is common in most parts of the northern hemisphere; the eared grebe, *P. auritus* or *nigricollis*, is closely related to it. Some of the grebes reach 2 feet in length, but most of them are much smaller. The plumage of the breast is of a beautiful silvery luster and satiny texture, and is much used to ornament ladies' hats, for muffs, etc. Grebes have many local popular names, as *arse-foot, dabchick, didapper, dipper, dopper, helldiver*, and *waterwitch*.

(*a*) A member of the ancient Greek race, one of the chief factors in the history of civilization, inhabiting the territory of Greece, comprising part of the southeastern peninsula of Europe and the adjoining islands, and also extensive regions on the coasts of Asia Minor, Sicily, southern Italy (Magna Græcia), etc. As a result of the conquests of Alexander the Great, many parts of western Asia, Egypt, etc., became partly Hellenized. The true Greeks, or Hellenes, consisted only of the Dorians, Æolians, Ionians, and Achæans; but the name *Greeks*, in its widest sense, includes many peoples of different stock, as the Macedonians, Epirotes, Acarnanians, etc. (*b*) A member of the modern Greek race, which has descended, with more or less foreign admixture, from the ancient race; especially, a subject of the modern kingdom of Greece.—2. The language spoken by the inhabitants of Greece or by persons of the Greek race. Greek is a branch of the great Indo-European family of languages, being thus ultimately akin to English. Ancient Greek comprised a large number of dialects spoken in Greece proper, and on the coasts of Asia Minor and the adjacent islands, as well as in the numerous colonies of Greeks along the coast of the Mediterranean and Black seas, from Syria and Egypt to Italy, Sicily, and Spain. Of these dialects, four are usually distinguished as having received literary cultivation, namely, Ionic, Doric, Æolic, and Attic. The Old Ionic appears in the Homeric poems (hence also called *Epic*); the New Ionic in the histories of Herodotus. The Doric includes a number of different dialects usually characterised as "rough" or "broad," as contrasted with Attic or Ionic, namely, Dorian, Laconian, Corinthian, Megarian, Delphian, Rhodian, Cretan, Cyrenian, Syracusan, etc., literary remains being scant (Theocritus, etc.). Æolic includes Lesbian, Bœotian, Thessalian, etc., also with scant literary remains (Pindar, Alcæus, Sappho, etc.). Doric and Æolic are made to include many other dialects loosely classified under these names. The Attic, the dialect of Athens, became the standard literary tongue of Greece, and contains nearly the whole of Greek literature. In its later form, as the common dialect, it became the general language of the Greek peoples. As the common speech at Alexandria and in Palestine, it was the language in which the Old Testament became current (the Septuagint), and in which the New Testament was written. It continued, with slight changes, to be the literary language of the Greek world until the fall of the Eastern Empire; and the popular spoken form, with profound internal changes, has continued to the present day, being now the standard language of the new Kingdom of Greece, and showing a strong tendency, under the fostering care of patriotic scholars and teachers, to resume the external forms of the ancient Greek. (See *Romaic*.) The Greek language is embodied in a literature of extraordinary variety, extent, and permanent interest, comprising works which take the first rank in nearly all the forms of literary art, and have been the accepted models of Roman and modern literature. The language is highly synthetic, having an unlimited facility of derivation and composition; and by reason of this characteristic, and of its richness in idiomatic particles and condensed forms of expression, it lends itself to all the forms of literary art. Its vocabulary is extremely copious, and has been drawn upon freely by the Latin and by modern tongues, being now, with the Latin, the accepted storehouse from which the new terms

needed by modern science are generally derived. Together with Latin, the Greek language has long formed the accepted basis of a scholarly education. Modern interest in its study dates from the fifteenth century, when the Turkish inroads upon the Byzantine empire, and particularly the conquest of Constantinople in 1453, caused the permanent settlement of many Greek scholars in Italy, and hence influenced profoundly the development of the Renaissance. (See *Renaissance*.) Greek is divided chronologically, in the etymologies of this work, into *Greek* proper (Gr.), ancient or classical Greek to about the year A. D. 200; *late Greek* (LGr.), from that time till about A. D. 600; *middle Greek* (MGr.), till about A. D. 1500; and *modern* or *new Greek* (NGr.), since that date; these periods corresponding to similar periods of Latin. (See *Latin*.) Middle and New Greek are also called *Romaic*. Greek is usually printed in type imitated from the forms of letters used in the later manuscripts. The most ancient manuscripts and the inscriptions exhibit only the capital or uncial forms, without accents and without separation of words. The small letters are comparatively modern. Since it is the only language printed in this dictionary in other than Roman letters, the Greek alphabet, with the Roman equivalents, is here given:

Form.	Equivalent.	Name.	Form.	Equivalent.	Name.
Α α	a	Alpha	Ν ν	n	Nu

See *Trojan*.—**As merry as a Greek.** See *merry Greek*.—**Merry Greek**, a jovial fellow; a jolly, jesting person: in allusion to the light, careless temper ascribed to the Greeks, and usually with reference to the proverb "as merry as a Greek," which was confused with a similar proverb, "as merry as a grig," of different origin. II. *a.* Of or pertaining to Greece or the Greeks; Grecian; Hellenic.—**Greek art**, the art developed in ancient Greek lands, and of which the artists of Athens were the highest exponents. It was early modified by the imitation of foreign models, chiefly Oriental and Egyptian, and reached its highest perfection in the fifth century B. C. Among its salient qualities are originality, vigor, truth, wise moderation, and self-restraint, together with the ever-present love of beauty and hatred of excess, the delicacy of perception and cult of pure intelligence, characteristic of the Greek race, from which, however, a keen appreciation of the practical is never absent. The progress of Greek art can most consecutively be followed in the minor art of vase-painting. The most ancient Greek pottery, that of Hissarlik (Troy), presents no obvious Greek character. The related ware of the island of Thera, which can safely be dated as earlier than 1500 B. C., shows in its decoration the awakening of the Greek spirit, which becomes more and more accentuated, and at the same time shows the effects of foreign intercourse, in the oldest vases of other Ægean islands, of Mycenæ, Corinth, and Attica. Vase-painting was finally abandoned about 200 B. C. A few figures, from vases that can be closely dated, are given to indicate the general course and tendency of Greek art. Other illustrations, referring to all departments of this art, will be found throughout this work. See *Æginetan (sculptures)*, *archaic*, *Erechtheum*, *figurine (Tanagra)*, *Hellenic*, *marbles (Elgin* and *Pergamene)*, *Phidian*, *vases (Greek)*, etc. (*a*) *Greek painting*, from the fame in antiquity of such artists as Polygnotus, Zeuxis, Apelles, Parrhasius, cannot have been behind its fellow-arts; but all the originals have perished, and the materials for study include little more than the pale reflections afforded by Pompeiian and other Roman wall paintings, by some frescoed tombs in Italy, Greece, and the Crimea, and by one or two painted sarcophagi of Etruria and of Asia Minor. (*b*) *Greek sculpture* developed comparatively late, but by the beginning of the fifth century B. C. it had gained a position on a par with that of architecture. The earliest Greek sculpture was in wood (see *xoanum*); all examples of it have perished. Later, this was imitated in stone (of which an Artemis of the seventh century B. C., found at Delos, is a good specimen) and in bronze, the first use of the latter material being ascribed to the artists of Chios and Samos. In the latter half of the sixth century were produced the beautiful painted archaic statues which, until they were unearthed during the last decade, remained buried on the Athenian Acropolis from the time of their entombment during the improvements which followed the Persian wars. (See *archaic*.) The Æginetan marbles (see *Æginetan*) of the beginning of the fifth century mark the last period of the archaic. The remainder of the fifth century was the period of Phidias (see *ethos*, 2) and the artists grouped about his name, as Myron and Polycletus. In the following century majesty and the lofty ideal gave place to a more individual and intimate quality (*pathos*) and to grace, of which Praxiteles was the most prominent exponent, with Scopas and others hardly less famous. The abundant and charming Greek terra cottas throw a side light on Greek sculpture akin to that supplied by painted vases for the study of Greek painting. (*c*) The *architecture* of the Greeks was developed from a primitive framed inclosure in wood or rough stones, with a sloped roof to shed the rain. As fully developed it implies the presence of columns, both as supports and for ornament, in a system of lintel construction (see *entablature*), or vertical resistance to superimposed weight. The arch was known to the Greeks, but was practically never employed by them where it could be seen. The most typical production of Greek architecture is the peripteros, or temple of which the cella is entirely inclosed by ranges of columns supporting a low gabled roof. The normal plan of such buildings is rectangular, the length being slightly more than twice the breadth; but the exigencies of special use or of the nature of the site often led to wide deviations from the type, as in the Erechtheum at Athens; and circular buildings of various kinds were not uncommon. The idea of the column was probably imported from Egypt (Doric) and from Assyria (Ionic), as were many motives of decoration, as the fret, and the anthemion, which was derived in direct line, though transformed, from the lotus-blossom. (For the Greek orders, the Doric, Ionic, and Corinthian, see these words.) Greek architecture found its highest expression in stone, particularly in marble. The structures in wood have, of course, perished, and must be studied from allusions in literature and inscriptions, from certain details of stone buildings, and such remains as the terra-cotta copings of some Athenian tombs, of which the edicules in wood have disappeared, and in vase-paintings. Baked bricks are rare or not found in truly Greek work, unless possibly in prehistoric times. Much use, however, was made of unburned brick, even at a comparatively late date, and considerable remains of such work have been found at Olympia, at Elensis, and elsewhere. The marble buildings of the period of perfection, simple and imposing in their general composition, were enriched with statuary and sculptured ornament and brilliantly colored (see *polychromy in architecture*, under *polychromy*) to bring out all their details with full effect in the clear air of the Mediterranean. Until Macedonian preponderance had vitiated the ideals of independent Greece, all this magnificence of art was reserved for the glory of the gods and the public buildings of the state. Luxury in private life was not approved, private houses being small and plain. See *masonry (Greek)*.—**Greek Church**, the church of the countries formerly comprised in the Greek, Greco-Roman, or Eastern (Roman) Empire, and of countries evangelised from it, as Russia; the church, or group of local and national Oriental churches, in communion or doctrinal agreement with the Greek patriarchal see of Constantinople. It is also called the *Eastern Church*, in distinction from the *Western*, the *Latin*, or *Roman Catholic Church*. The full official title of the Greek Church is the *Holy Orthodox Catholic Apostolic Oriental Church*. (See *Catholic*, *a.*, 3 (*c*).) The epithet *Orthodox* is that most frequently used for the Greek or Eastern Church. The estrangement between the Greek and Latin churches, culminating finally in the Great Schism, stands historically in close connection with the division of the Roman Empire into an Eastern and a Western Empire, with the growing power of the see of the new Roman capital, Constantinople or New Rome, the increasing rivalry between the see of Old Rome and that of New Rome, the insertion by the Latin Church of the *filioque* (see *Filioque*) in the Nicene Creed, the question of the ecclesiastical allegiance of the Bulgarians, and of the papal supremacy. Eastern Illyricum, including Greece, with the chief see at Thessalonica, which had belonged to the Roman patriarchate, remained with the Eastern Church. Before the ninth century there had been temporary suspensions of communion between the Roman Church and the East. The Great Schism began, however, in the latter part of the ninth century, the principal doctrinal difficulty relating to the *Filioque*. The immediate occasion of suspension of communion was the intrusion by the emperor Michael III., in A. D. 857, of the learned Photius into the see of Constantinople instead of Ignatius, at that time patriarch. The Roman see asserted jurisdiction in the matter as possessing supreme power, and mutual charges of false doctrine and excommunications followed; but Photius was finally acknowledged at Rome as patriarch. The final division was that between Pope Leo IX. and the patriarch Michael Cerularius, in A. D. 1054, since which time Roman Catholics regard the Greeks or Easterns as cut off from the Catholic Church; the Greeks, on the other hand, claim that they have remained faithful to the catholic creed and ancient usages. The Greek Church is the dominant form of Christianity in the kingdom of Greece, the archipelago with the opposite coast and Cyprus, in European Turkey among both Slavs and Greeks, in part of Austria and Hungary, throughout the Russian empire, and in Rumania, Bulgaria, Servia, and Montenegro. In most of these countries the church authorities are independent of the patriarch at Constantinople. It acknowledges the first seven ecumenical councils. The doctrine of the Greek and that of the Western Church with regard to the Trinity, apart from the question of the *filioque* and double procession, and that with regard to the person of Christ, are the same. Baptism is regularly conferred on infants with trine immersion. Confirmation follows immediately upon baptism. Communion is given in both kinds, and to infants as well as adults. The offices of bishop, priest, and deacon are regarded as the three "necessary degrees" of orders. The highest officers of the church are the four patriarchs of Constantinople, Alexandria, Antioch, and Jerusalem, and the Russian Holy Governing Synod. Honor is paid to relics as in the Roman Catholic Church. The ordinary secular clergy can marry before ordination, but their wives must have been previously single, and they cannot remarry. Only the monastic clergy are advanced to the episcopate and other offices. The liturgical language is not absolutely fixed: in Greek-speaking communities it is Greek; in Slavonic communities, not Russian, but the ancient language known as Ecclesiastical Slavonic or Old Bulgarian.—**Greek cross.** See *cross*[1].—**Greek embroidery**, fancy work executed by sewing upon a background pieces of colored cloth, silk, etc., and embroidering the edges of these and the background between them with chain-stitch and other ornamental stitches.—**Greek fire.** See *fire*.—**Greek key-pattern**, a meander.—**Greek lyre.** See *lyre*.—**Greek modes.** See *mode*.—**Greek partridge.** See *partridge*.—**Greek point-lace.** See *lace*.—**Greek sculpture.** See *Greek art* (*b*).—**On or at the Greek calends.** See *calends*.

II. *n.* 1. The color of ordinary foliage; the color seen in the solar spectrum between wave-lengths 0.511 and 0.543 micron. According to the theory generally accepted by physicists, the sensation of pure green is a simple one. This sensation cannot be excited alone in a normal eye; but the spectrum at wavelength 0.524 micron, if the light be very much reduced, probably excites the sensation with some approach to purity. It is a common error to suppose that green is a mixture of blue and yellow. This notion arises from the observation that a mixture of blue and yellow pigments generally gives a green. The reason of this is that the color of pigments not having a true metallic appearance is that of the light which they transmit; the blue pigment cuts off the yellow rays and the yellow pigment the blue rays, but certain green rays are transmitted by both. But blue and yellow lights thrown together upon the retina excite a sensation nearly that of white, which may incline slightly to green or to pink according to the tinge of the colors mixed. Green under a high illumination appears more yellowish (the sensation being affected by the color of brightness), and darkened appears more bluish; this is especially true of emerald and yellowish greens (above all, of olive greens), and hardly holds for turquoise-green. The terms and phrases below are the common names for hues of green, some of them being also names of pigments.

greenstone (grēn'stōn), *n.* [First used in G. (*grünstein*): so called from a tinge of green in the color.] 1. Any one of various rocks, of eruptive origin, in general older than the Tertiary, crystalline-granular in texture, and of a dark-greenish color. The essential ingredients of the rocks formerly classed under the name of *greenstone* are triclinic feldspar and hornblende, with which are associated various other minerals in greater or less quantity, and especially chlorite, mica, magnetite, and apatite. The name is abandoned by some lithologists, but retained by

many geologists as a convenient designation for those older eruptive rocks which have undergone so much alteration that their original character is in a measure lost, and cannot be made out except with the aid of the microscope, and not always with that help. The most important of these changes seems to be that the original augite has been converted into hornblende, while a still more advanced stage of alteration is indicated by the presence of chlorite, mica, and other minerals, the predominating color of which is greenish, and to this peculiarity the rock owes its name. While there can be little doubt that many of the so-called greenstones, or melaphyres and diorites, as rocks of this class have of later years been often designated, are altered basalts, there is far from being a general agreement among lithologists as to the proper limitation of these names. See *basalt, diorite, melaphyre, trap.*

Gregarina (greg-a-ri'nā), *n.* [NL., < L. *gregarius*, gregarious, + *-ina.*] 1. The typical genus of the *Gregarinidæ*. *G. gigantea*, the gregarine of the lobster, attains a length of two thirds of an inch.—2. [*l. c.*; pl. *gregarinæ* (-nē).] One of the *Gregarinidæ;* a gregarine.

The *gregarinæ* have a peculiar mode of multiplication, sometimes preceded by a process which resembles conjugation. A single *gregarina* (or two which have become applied together) surrounds itself with a structureless cyst. The nucleus disappears, and the protoplasm breaks up . . . into small bodies, each of which acquires a spindle-shaped case, and is known as a pseudo navicella. On the bursting of the cyst these bodies are set free, and . . . the contained protoplasm escapes as a small active body like a Protamœba.
Huxley, Anat. Invert., p. 87.

Gregarinida (greg-a-rin'i-dā), *n. pl.* [NL., < *Gregarina* + *-ida.*] The *Gregarinidæ*, in the widest sense, as a class of protozoans, divided into *Monocystidea* or simple-celled gregarines, and *Dicystidea* or septate gregarines: nearly synonymous with *Sporozoa* (which see). See *Gregarinidæ, Gregarinidea.* Also called *Cytozoa.*

Gregarinidæ (greg-a-rin'i-dē), *n. pl.* [NL., < *Gregarina* + *-idæ.*] A family or other major group of endoplastic protozoans, having sphe-

roidal, ovoid, or elongated bodies, sometimes with a segmental constriction, and occasionally one end of the body beaked with an epimerite bearing curved horny spines. They have no pseudopodia in the adult state, the body ordinarily presenting a dense cortical layer or ectosarc, and a more fluidic inner substance or endosarc containing an endoplast, but no contractile vacuole. Changes of form are effected by a power of contractility, and the animals are nourished by absorption of nutriment already prepared in the bodies of the animals in which they are parasitic, as insects, worms, and crustaceans. Reproduction is effected, with or without conjugation, by a process of sporation in which an encysted individual becomes filled with a mass of peculiar bodies known as *pseudo-navicellæ*, which discharge amœboiform contents sometimes called *flagellula* or *drepanidia*. All *Gregarinidæ* are parasitic, but none, as far as known, infest vertebrates. The family name applies – (1) to all gregarines; (2) especially to the septate gregarines, for which *Dicystidæ* is also used. Numerous genera have been proposed, but few can be considered established, as *Monocystis* of the single-celled division, with *Gregarina* proper and *Hoplorhynchus* of the septate division. Those two divisions correspond, respectively, to *Monocystidea* or *Haplocysta*, and to *Dicystidea* or *Septata*, when the family is ranked as a class or subclass named *Gregarinida* or *Gregarinidea*.

A, Gregarina of Earthworm; *B*, same encysted; *C*, *D*, contents divided into pseudo-navicellæ; *E*, *F*, free pseudo-navicellæ; *G*, *H*, their free amœboiform contents. (Highly magnified.)

These accessory minerals are topaz, fluor-spar, rutile, tourmaline, and others, and especially cassiterite (oxid of tin), which is almost invariably found associated with this rock. Originally, a soldier who threw hand-grenades. Soldiers of long service and acknowledged bravery were selected for this duty. They were the foremost in assaults. At first there were only a few grenadiers in each regiment, but companies of grenadiers were formed in France in 1670, and in England a few years later. When hand-grenades went out of general use, the name was still retained for the company, the members of which were of great stature and were distinguished by a particular uniform, as for instance the high bearskin cap. In the British and French armies the grenadier company was the first of each battalion. Now the companies of a battalion or a regiment are equalized in size and other matters, and the title in the British army remains only to the regiment of Grenadier Guards.

E. *bridegrome*, the second element is unquestionably for earlier *goom*, *gome*, being appar. a conformation to the word *groom*[1]; but this does not prove the identity of the simple words. ME. *gome* means 'man' in an elevated sense, not implying subordination (except as it may be that of a soldier to his chief), and is chiefly, in AS. wholly, confined to poetry, while ME. *grome* always means 'boy,' or else 'man' as a servant or menial, and is frequent in prose as well as in poetry; moreover, the two words occur in the same piece with these differing senses. *Groom* is therefore to be taken as an independent word.] 1†. [*Guarantee* is often used for *guaranty*, but in legal matters it is more correct to use *guaranty* for the name of the promise or contract of guaranty, *guarantor* for the maker of the guaranty, and *guarantee* for the person for whom the guaranty is made, and also for the act of performing the guaranty.]

Toward the end of that century the knuckle-bow was added, some swords combining these two additions with two straight quillons of which the cross-guard is formed. (See cut under *hilt*.) Another guard of this epoch was the shell-guard. The basket-hilt came into use toward the close of the sixteenth century and lasted through the seventeenth. (See cut under *claymore*.) In the second half of the seventeenth century the guard became more simple, and consisted chiefly of a knuckle-bow, the shell of the guard when still used being reduced to a very small saucer-shaped plate surrounding the blade. The knuckle-bow guard continued in use throughout the eighteenth century in swords worn with civil costume, as well as in most of those used in war, and is still the guard of the modern sword and saber, some cavalry sabers and the like having this knuckle-guard so expanded laterally as to approach the form of the basket-hilt. [This use is common in English literature from the first appearance of the word; but it is now regarded as colloquial, and, from its frequency in the United States, it is generally supposed by Englishmen to be an "Americanism." By an easy extension *guess* is used for *think*, *believe*, or *suppose*, even where the meaning is not at all conjectural, but positive, and it is then logically superfluous, serving merely to make the assertion less abrupt: as, I *guess* I will go now (that is, I am going now); I *guess* I know what I'm about (that is, I know what I am doing). In most instances this use probably arises from a desire to avoid positive assertion, or from some feeling of hesitation or uncertainty.]=Syn. 1. *Imagine*, *Presume*, etc. See *conjecture*.

The color of usual varieties is a dark gray, beautifully variegated with a profusion of small white spots; whence the ancient Latin and modern specific name *meleagris*, the spots being fancifully taken for the tears shed by the sisters of Meleager at his fate. Partial and perfect albinos also occur in domestication. The guinea-fowl was well known to the Romans, and has long been common in poultry-yards. Both flesh and eggs are esteemed as food. These cavies are readily tamed, and are noted for their extraordinary fecundity.

The genus Cavia includes numerous species more or less like the common *guinea-pig*, though none of the wild ones resemble the piebald individuals commonly seen in confinement. . . . In domestication, the *guinea-pig* is probably the most prolific of mammals, the periods of gestation and lactation being remarkably brief, the litters large, and procreation almost continual.

The strings are plucked or twanged by the right hand, while they are stopped by the left hand upon small frets placed at regular intervals upon the finger-board. As usually tuned, the compass is between three and four octaves upward from the second E below middle C. The usual tuning of the strings is shown at *a*, the music being written an octave higher. As the fixed frets prevent distant modulations from the normal key of the instrument, a capo tasto is sometimes attached so as to shorten all the strings at once. The guitar is the modern form of a large class of instruments used in all ages and countries. It is most popular in Spain, but has had periods of great popularity in France and England. Its tone is soft and agreeable, and is especially suited for accompaniments.

gulf (gulf), *n.* [Formerly often *gulph*, sometimes *goulfe* (= D. *golf*, a wave, billow, gulf, = G. *golf*, a bay); < OF. *golfe*, *goulfe*, a gulf, whirlpool, F. *golfe*, a gulf (bay), a later form (after It. *golfo*, etc.) of OF. *goufre*, F. *gouffre*, a gulf, abyss, pit, = Pr. Sp. Pg. It. *golfo*, a gulf, bay, < LGr. κόλφος, Gr. κόλπος, the bosom, lap, a deep hollow, a bay, a creek (cf. L. *sinus* in similar senses: see *sinc*).] **1.** A large tract of water extending from the ocean or a sea into the land, following an indentation of the coastline: as, the *Gulf* of Mexico; the *Gulf* of Venice. A gulf is usually understood to be larger than a bay and smaller than a sea, but in many cases this distinction is not observed. Thus, the Arabian sea on one side of the Indian peninsula is of nearly the same size and shape as the Bay of Bengal on the other, while the Bay of Biscay is many times larger than the Gulf of Genoa.

They [the Venetians] prohibiting all traffique elsewhere throughout the whole *Gulph*. *Sandys*, Travailes, p. 1.

England his approaches makes as fierce
As waters to the sucking of a *gulf*.
Shak., Hen. V., ii. 4.

A *gulf* of ruin, swallowing gold.
Tennyson, Sea Dreams.

4. A wide interval, as in station, education, and the like: as, the *gulf* that separates the higher and lower classes.—5. In Cambridge University, England, the place at the bottom of the list of passes where the names of those who have barely escaped being plucked in examination are written. These names are separated by a line from those of the students who have passed creditably.

The ranks of our curatehood are supplied by youths whom at the very best merciful examiners have raised from the very gates of "pluck" to the comparative paradise of the *gulf*. *Saturday Rev.*

Some ten or fifteen men just on the line, not bad enough to be plucked or good enough to be placed, are put into the *gulf*, as it is popularly called (the Examiners' phrase is "Degrees allowed"), and have their degrees given them, but are not printed in the Calendar.
C. A. Bristed, English University, p. 259.

6. In *mining*, a large deposit of ore in a lode.—**Gulf Stream**, an oceanic current which first becomes apparent near the north coast of Cuba, whence it advances eastward to the Bahamas, then, turning northward, follows the Atlantic coast with a velocity of from 2 to 5 miles an hour, gradually expanding in breadth and diminishing in depth, but distinctly perceived beyond the eastern edge of Newfoundland as far as about 30 degrees west longitude. Its average breadth from Bermuda to the neighborhood of Nova Scotia is from 300 to 400 miles. Its comparatively high temperature (10 to 20 degrees above that of the surrounding ocean), rapid motion, and deep-blue color make the Gulf Stream a most remarkable phenomenon, and even more interesting than the Kuro Siwo, the corresponding current on the Asiatic coast of the Pacific ocean. The Gulf Stream exerts a most important influence in moderating the climate of France, the British islands, and other parts of western Europe. The distance to which the influence of the Gulf Stream is felt in a northeasterly direction has been the subject of much discussion among thalassographers. It seems pretty clearly established, however, that a considerable proportion of the effect produced on the climate of northern Europe which was formerly ascribed exclusively to the Gulf Stream is in reality due to a current coming from the Antilles (the Antilles Stream), which joins the Gulf Stream to the north of the Bahamas.

gulf (gulf), *v.* [Formerly also *gulph*; < *gulf*, *n.* Cf. *engulf*.] I. *trans.* 1. To swallow; engulf; cast down, as into a gulf.

2. In the University of Cambridge, to place in the gulf, or among those students who have barely escaped being plucked in their final examination.

C. A. Bristed, English University, p. 259.

gulfweed (gulf'wēd), *n.* A coarse olive seaweed, *Sargassum bacciferum*, belonging to the suborder *Fucaceæ*. It has its specific name from the numerous grape-like air-vessels by which it is buoyed. It was first discovered by Columbus. *S. vulgare* is also sometimes called gulfweed. Gulfweed grows attached in the West Indies, where it fruits, and is found floating and infertile in the course of the Gulf Stream and in the Sargasso sea (a tract of water so called from the masses of floating gulfweed in it, sometimes so dense as to impede navigation), from latitude 20° to 45° N. *Farlow*, Marine Algæ of New England. Also called *drift-weed*.

gull² (gul), *n.* [< Corn. *gullan* = W. *gwylan* = Bret. *gwelan*, a gull. Cf. *guillemot*.] 1. A long-winged, web-footed bird of the subfamily *Larinæ*, family *Laridæ*, and order *Longipennes*. There are more than 50 species, inhabiting all parts of the world, belonging chiefly to the leading genus *Larus*; other genera are *Chroicocephalus*, *Xema*, and *Rhodostethia*. Many of the species are marine or maritime, but gulls are also found over most of the large bodies of fresh water of the globe. They are strong and buoyant fliers, spending much of the time on the wing, and are voracious feeders upon fish or any animal substances which they can find in the water. They do not dive. The nest is usually placed on the ground or on rocks, and the eggs are two or three in number and heavily colored. The voice is raucous or shrill, and the birds are very noisy, especially during the breeding season. The characteristic coloration is white with a pearly, bluish, or fuscous mantle, the primaries usually marked with black; the white in some cases has a beautiful rosy hue. In one group of species the head is enveloped in a dark-colored hood; in another the whole plumage is dark, except the white head; in the ivory gull the entire plumage is white. In the kittiwakes, which constitute the genus *Rissa*, the hind toe is rudimentary. Among representative species are the ice-gull or burgomaster, *Larus glaucus*, and the great black-backed gull, *L. marinus*, these two being the largest species; the herring-gull, *L. argentatus*; the mew-gull, *L. canus*; the hooded gulls, *Chroicocephalus atricilla*; the fork-tailed gull, *Xema sabini*; and the wedge-tailed gull, *Rhodostethia rosea*. In the larger gulls the bill is strong and hooked; in the smaller kinds it is slenderer and straighter, and these grade directly into the terns or sea-swallows. See cuts under *burgomaster* and *Chroicocephalus*.

The breech-loading projectile, which is coated with lead, is inserted into a chamber behind the bore, and is driven forward by the explosion with the effect of forcing its soft coating into the grooves, so that it receives a rotary motion. The commonest form of the gun is breech-loading; but muzzle-loading Armstrong guns also are made.—**As sure as a gun**, quite sure; certainly. [Colloq.]

The parts are assembled upon various systems, the general aim of all being to establish a system of parts that shall best resist the internal strains set up by the explosive gases of the powder. The exterior hoops or jackets are shrunk on over the internal parts by first expanding by heat and cooling in position.—**Centrifugal gun.** See *centrifugal*.—**Crozier wire-wound gun**, a gun composed of a heavy tube wrapped with steel wire. The special feature of its construction is the initial compression of the tube beyond the elastic limit of the metal.—**Dahlgren gun**, a smooth-bore gun of cast-iron, invented by Lieutenant (afterward Rear admiral) J. A. Dahlgren (1809–70) of the United States navy. Its principal peculiarities are the unbroken smoothness of its surface and the relation of its thickness at all points (determined by experiment) to the pressure in firing.—**Evening gun** (*milit.* and *naval*), the warning gun at sunset. In the United States army the time of challenging is regulated by post-commanders, and it is generally later than the time of firing the evening gun. This gun was the successful pioneer of the machine guns. It has from 5 to 10 barrels, with a lock for each barrel; the barrels are arranged in a cluster around a central axis, and both barrels and locks revolve together. The cartridges are fed from a feed-case into a hopper on top, and in the later models from a feed-magazine. With the 10-barrel gun a fire of about 1,000 shots per minute can be delivered. These guns are made of the following calibers: 0.30, 0.42, 0.43, 0.45, 0.50, 0.55, 0.65, 0.75, and 1 inch. They are mounted upon a tripod or a carriage, according to the service for which they are intended. See cut in preceding column.—**Great gun.** (*a*) A cannon. The charge in the breech-chamber is ignited by a friction or other primer; this charge starts the projectile forward, and as its base passes consecutively the openings of the subsidiary chambers or pockets, the charges contained therein are ignited.—**Napoleon gun**, a bronze 12-pounder used for field-artillery, first adopted in France about 1856, under Napoleon III.—**Neck of a gun.** See *neck*.—**Paixhans gun**, a howitzer for the horizontal firing of heavy shells, introduced by the French general H. J. Paixhans about 1825.—**Palliser gun**, a cast-iron gun lined with a tube of coiled wrought-iron, invented by Major Palliser of the British army about 1870. The tube is made in two parts, the breech-end being shrunk on. This system was designed to utilize the old smooth-bore ordnance, by converting it into rifled guns.—**Parrott gun**, a cast-iron rifled gun strengthened at the breech by shrinking coils of wrought-iron over it, invented by Captain Parrott of the Cold Spring foundry in New York, and first used in 1861. The powder-gas presses against the bottom and under it so as to expand it into the grooves, and thus assures rotary motion to the projectile.—**Pneumatic gun**, a gun employing compressed air for discharging a shell charged with high explosives. The pneumatic gun adopted by the United States for coast defense has a caliber of 15 inches and throws a shell carrying from 150 to 500 pounds of explosive gelatin. It has a range of three miles.—**Powder pneumatic gun**, a pneumatic gun in which the explosion of a small charge of gunpowder is used to compress the air used for discharging the shell.—**Quaker gun**, a log of wood mounted on wheels or some other arrangement, imitating a cannon, designed to deceive the enemy: so called in humorous allusion to the peace doctrines of the Quakers or Friends.—**Quick-fire gun**, a name sometimes given to large rapid fire guns, especially to one that uses a projectile that is separate from the case containing the powder.—**Rampart gun**, a large piece of artillery fitted for use on a rampart, and not for field purposes.—**Rapid-fire gun**, a breech loading gun of from 1½ to 8 inches' caliber which uses metallic ammunition. Each type is designated by the name of the inventor of the breech-loading system used, as the Gerdom, Fletcher, Seabury, Dashiel, Canet, Schneider, Armstrong, Driggs-Schröder, Maxim Nordenfelt, Hotchkiss, Gruson, and others.—**Rodman gun**, a cast-iron gun with curved outline, being much thicker over the seat of the charge than elsewhere. The peculiarity of this gun is the method of casting, devised by General Rodman of the United States Ordnance Department, and first employed in 1860. Instead of cooling from the exterior, as in the ordinary method, General Rodman cast all large guns with a hollow core, and cooled them from the interior by a stream of cold water or air, at the same time preventing undue radiation from the exterior by surrounding the flask holding the casting with heating-furnaces.—**Sims-Dudley pneumatic gun**, a powder pneumatic gun, the best known form of which consists of three parallel tubes, of which the center one is much longer than the other two. Both the center and right-hand tubes open at the breech, the former for the introduction of the projectile and the latter for the powder charge. In action, the powder is exploded in the right barrel and the gases pass to its front end, then across to the left barrel, and are finally admitted behind the projectile in the center barrel, mixed with the air in the two side barrels which has been compressed by the process. Shells containing sensitive high explosives can thus be discharged without shock sufficient to cause explosion.—**Son of a gun**, a rogue; a knave: used humorously.—**Spencer gun**, an American magazine-rifle containing seven cartridges in a metallic tube, which is inserted in the butt-stock from the rear. The magazine is operated by a lever in the under side of the arm.—**Springfield gun**, a single-loader with a hinged block, used in the United States army.—**To blow great guns** (*naut.*), to blow tempestuously, or with great violence: said of the wind.

Vetterli]. (*a*) A single-loading small-arm, caliber 0".408, used in the Italian army. (*b*) A magazine bolt-gun used in the Italian and Swiss armies.—**Whitworth gun**, an English rifled firearm, whether great or small, hav-

ing a hexagonal bore, with a twist more rapid than usual: invented by Sir Joseph Whitworth.—**Winchester gun**, an American magazine-rifle having a horizontal bolt and vertical cartridge-carrier operated by a lever on the under side of the stock. The magazine is below the barrel and in front of the receiver.—**Wire gun**, a built-up gun made by winding wire about a tube, or by covering the tube with alternate layers wound circumferentially and laid longitudinally. See *Woodbridge gun*.—**Woodbridge gun**, a gun consisting of a thin steel tube wound with square wire, the interstices being filled with melted brazing-solder to consolidate it into one mass.—**Woolwich gun**, a built-up muzzle-loading cannon used in the British service. The tube is made of solid cast-steel drawn out by heating and hammering. After boring, turning, and chambering, the tube is heated to a uniform temperature and plunged into a covered tank of rape-oil to harden and temper it. Wrought-iron coils are shrunk on over the tube to complete the structure. The breech-coil is formed of a triple coil, a trunnion-ring, and a double coil welded together. The muzzle-coil is composed of two single coils united by an end-weld. The breech-piece is screwed into the breech-coil so as to abut against the rear end of the tube. The gun is assembled by heating the coils, and these when expanded are slipped over the tube and allowed to contract. The tube is kept cool during this operation by forcing a stream of cold water through the bore. These guns have from 7 to 10 grooves semicircular in cross-section, with curved edges and with a uniformly increasing twist. Also called *Fraser gun*. (See also *casemate-gun*, *dynamite-gun*, *machine gun*, *needle-gun*, etc.)

on wooden trucks and controlled by tackles; but the requirements of modern gunnery have caused wood to be replaced by brass and iron or steel, and simple tackles by powerful gearing and machinery. In the case of a field- or siege-piece the carriage unites, for traveling, with a fore part fixed on a pair of wheels, called a *limber*, to which the horses are attached, so as to form a single four-wheeled carriage. In action it is unlimbered or detached from the fore part, and then rests on its wheels and on a strong support called the *trail*.—**Disappearing gun-carriage**, a gun-carriage so arranged that the gun after being fired descends, under the influence of the force of recoil, to the loading position behind the protection of the parapet, where it can be manœuvered without exposing the gun detachment to the enemy's fire. During the recoil of the gun sufficient energy is stored up, by means of a counterweight or by air compression, to raise the gun to firing position when released. The *Buffington-Crozier disappearing gun-carriage* has been adopted for the seacoast service of the United States. The gun is mounted upon levers trunnioned in a top carriage which rolls back under the force of recoil. The lower ends of the levers are compelled to move between vertical guides and raise a counterweight. The constrained motion on two lines approximately perpendicular to each other, thus causing the gun to describe an arc of an ellipse in recoiling, is the mechanical principle of the carriage.

guncotton (gun'kot'n), *n.* A general name for the nitrates of cellulose, prepared by digesting cotton or other form of cellulose in nitric acid, or preferably in a mixture of nitric and sulphuric acids. A series of nitrates may thus be made, differing in composition and properties according to the strength of acids and time of digestion. Weak acids and short digestion yield trinitro- and tetranitro-cellulose, which dissolve in a mixture of alcohol and ether. This solution is the collodion of commerce. A highly explosive nitrate to which the name guncotton more properly belongs, is made by digesting clean cotton in a mixture of 1 part nitric acid, specific gravity 1.5, and 3 parts sulphuric acid, specific gravity 1.85, for 24 hours and thoroughly washing the product. This is a hexanitrate of cellulose, $C_{12}H_{14}(NO_3)_6O_{10}$. It can hardly be distinguished by appearance from raw cotton, and is insoluble in alcohol and ether. When ignited it burns quietly, leaving no residue, but by percussion explodes violently, especially if compressed. Its explosive force is much greater than that of gunpowder. It has been used chiefly for torpedoes and submarine blasting, but is now largely superseded by dynamite.

The finished powder is employed for the discharge of projectiles from guns, in blasting, and for other purposes. The proportion of the ingredients in the composition of gunpowder varies in different countries, and with the different uses for which it is designed. The powders used for military purposes are distinguished, according to the fineness and evenness of granulation, as (*a*) irregular, as *musket, mortar, cannon,* and *mammoth* powders; (*b*) regular, as *cubical, pellet, hexagonal, spherohexagonal,* and *prismatic* (perforated hexagonal prisms) powders. These powders may have the same composition, but differ in size and form of grain, density, and method of manufacture. *Musket powder* is used for small-arms, *mortar-powder* for field-guns, *cannon powder* for light siege-guns, and the larger-grained and special powders for heavy sea-coast guns. Mixtures of a nature similar to gunpowder were known in China and India from remote times, and were especially used for rockets. The invention of gunpowder in Europe has been ascribed to Roger Bacon (about 1214–94) and to a German monk named Schwarz (about 1320), but it was probably introduced into Europe through the medium of the Moors early in the fourteenth century. Its common use in warfare dates from the sixteenth century.—**Caking gunpowder.** See *cake*[1], *v. t.*—**Gravimetric density of gunpowder.** See *density.*—**Gunpowder paper,** an explosive substance consisting of an explosive mixture sprad on paper, dried, and rolled up in the form of a cartridge.—**Gunpowder plot,** in *Eng. hist.*, a conspiracy to blow up the king (James I.) and the lords and commons in the Parliament House, in 1605, in revenge for the laws against Roman Catholics. The defeat of this plot by its discovery was long celebrated publicly on the 5th of November, and still is to some extent privately, by processions and the burning in effigy of Guy Fawkes, its principal agent, who was executed.—**Gunpowder tea,** a fine species of green tea, being a carefully picked hyson, the leaves of which are rolled and rounded so as to have a granular appearance.—**Smokeless gunpowder,** a substitute for gunpowder which gives off little or no smoke when discharged in a gun and develops increased velocity in the projectile without increased pressure in the gun. It consists in general of an oxidizing agent and a substance added to regulate the explosive force. This latter is technically called a deterrent. Smokeless powders are classified according to the oxidizer used: (1) Picric acid powders (these are not generally stable); (2) ammonium-nitrate powders (these are highly hygroscopic); (3) guncotton powders; (4) nitroglycerin and guncotton powders. The first two classes have practically been abandoned. Smokeless powders are designated from their appearance, the name of the inventor, or arbitrarily, as *cordite, Peyton, poudre B.*, etc.—**White gunpowder,** a blasting-mixture composed of chlorate of potash, dried ferrocyanide of potassium, and sugar. It is now rarely used, owing to its liability to explode during manufacture, transportation, etc.

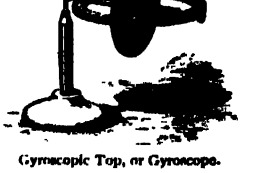
They are hydromedusans which pass through a hydriform phase, and in which medusiform bodies are developed. The *Gymnoblastea* are delicate plant-like marine organisms, usually attached to some foreign body. Their classification is difficult and unsettled. They have been divided into from 2 to 21 families. gyroscope (jī'rō-skōp), *n.* [= F. *gyroscope*, a name given in 1852 by Foucault to his improved form of Bohnenberger's apparatus, < Gr. *γῦρος*, a circle, + *σκοπεῖν*, view.] An instrument consisting of a fly-wheel, the axis of which can turn freely in any direction, designed to illustrate the dynamics of rotating bodies.



Foucault's Gyroscope.

The instrument commonly called *gyroscope* is better named *gyroscopic top* (which see, under *gyroscopic*). The *gyroscope* proper of Foucault, shown in the figure, consists of a fly-wheel having the small conical bearings of its axis in a well-balanced metallic ring which carries two knife-edges in a line perpendicular to the axis of the fly-wheel; these knife-edges bear upon agates carried in a horizontal plane by an outer vertical ring half suspended from a small copper wire and turning about a vertical axis. The axis of the wheel can thus turn in any direction. By means of an accessory apparatus a velocity of 180 turns a second can be imparted to the fly-wheel. The principal experiments with this apparatus are as follows: *First experiment.*—If, when the fly-wheel is turning rapidly, no considerable force is applied to change the direction of its axis, its direction will remain almost unchanged. For, suppose it were proposed, by an instantaneous impulse, to turn this axis round a fixed axis perpendicular to it; then, at the point where this fixed axis cuts the rim of the fly-wheel, a particle would have to be deflected, and it can be shown by the parallelogram of motions that a velocity must be communicated to it proportional to the velocity it already possessed. Hence, the force required to rotate the axis of a fly-wheel increases with its velocity. Accordingly, when the velocity is very high, the friction on the bearings will change the direction of the axis but very little. But all the surrounding objects partake of the rotation of the earth upon its axis. Consequently, the axis of the fly-wheel will have a relative rotation; and this may be observed with a microscope. *Second experiment.*—If the fly-wheel was attached to its axis by a hinge, so that its plane was free to take any inclination to the axis, it is plain that by virtue of centrifugal force it would become perpendicular to the axis, since in this way its particles would be furthest from the axis. If then the outer ring of the gyroscope be held fast in such a position that the axis of the fly-wheel is free to move in the meridian plane, it partakes of the rotation of the earth; and the rotation of the earth and that of the fly-wheel being compounded, the axis of resultant rotation is not quite perpendicular to the fly-wheel. Accordingly, the inner ring will turn on its knife-edges until the axis of the fly-wheel is brought into parallelism with that of the earth, so that the wheel revolves from west to east like the earth. *Third experiment.*—On the same principle, if the outer ring be free to turn, but the inner one be fixed horizontally, the outer ring will turn so as to bring the axis of the fly-wheel into the meridian. *Fourth experiment.*—Let the inner wheel be thrown out of balance by hanging a weight upon it near one end of the axis; then this weight will each instant communicate a rotation about the knife edges, compounding itself with the rotation of the fly-wheel about its axis as the rotation of the earth does in the third experiment, and a rotation of the outer ring round its vertical axis will result. Since the resultant axis of the first two rotations is very near that of the fly-wheel, the tendency of the weight to fall will be but slight, and under the influence of the centrifugal force of the third rotation it will move like a conical pendulum.—**Gyroscope governor**, a steam-governor in which a gyroscope is employed as a regulator. A change in the speed of the engine causes a heavy gyroscope to change its plane of rotation, this change in turn controlling the speed of the engine. See *governor*.

gyroscopic (jī-rō-skop'ik), *a.* [< *gyroscope* + *-ic*.] Pertaining to the gyroscope; illustrating the dynamical laws of rotation.

The fly-wheel being set in rotation, the axis moves about the fixed point in the manner explained under *gyroscope*, fourth experiment.

Gyrovagi, vagrant tramps who even at that time [528], as more than a century earlier, continued to bring discredit on the monastic profession. *Encyc. Brit.*, XVI. 704.

gyrus (jī′rus), *n.*; pl. *gyri* (-rī). [L., NL., < Gr. γῦρος, a circle, circuit, ring; cf. γυρός, round: see *gyre*.] In *anat.*, one of the rounded ridges into which the surface of the cerebral hemisphere is divided by the fissures or sulci; a convolution; a gyre. The gyri and sulci are complementary and mutually definitive. They are most numerous and best marked in the brain of the higher mammals (which are therefore called *gyrencephalous*), and especially in that of man. Every gyrus in man has its own name; but several different systems of naming are in vogue, and the nomenclature is still shifting. The attempt to identify the human gyri and sulci with those of other mammals encounters difficulties which have thus far been insurmountable except in the cases of the most constant and best-marked folds and fissures. (See the cuts.) Additional difficulty is encountered in the fact that different human brains vary in details of the gyri, and the same brain may differ on its opposite sides. The principal gyri are noted in the phrases below. The gyri represent an enormous increase in quantity of the gray cortical matter or cortex of the brain in comparison with the actual superficies of the cerebral hemispheres, some of the folds being separated by fissures an inch or more in depth, and containing three layers of gray matter with three layers of white. The gyri are to some extent an indication of intellectual power, and are better marked when the mental powers of the individual are at their height than in infancy and senility. The distinction between *gyrus* and *lobe* or *lobule*, as applied to lesser divisions of the surface of the brain, is not always preserved. *Gyrus* is exactly synonymous with *convolution*.—**Angular gyrus**, a certain gyrus of the hemisphere of the brain in man and monkeys. In man it is the short gyrus arching over the upper extremity of the superior temporal fissure, the hindmost one of four parietal gyri, separated by a short vertical sulcus from the supramarginal gyrus. See fig. 3, and cut under *cerebral*.—**Annectent gyrus**, a small or secondary fold, which may connect larger or primary convolutions: especially applied to several such gyri of the occipital lobe, as those forming the connections of the cuneus or occipital lobule. See cut under *cerebral*.—**Arched gyri**, four arched convolutions regularly arranged, in some carnivorous animals, as the dog and wolf, beginning with one which borders the Sylvian fissure and ending with one which forms the margin of the cerebral hemisphere. They are enumerated from *first* to *fourth*, as by Leuret, or in reverse order (Ferrier), or only three are recognised (Flower), when they are also called *inferior*, *middle*, and *superior* (Mivart).—**Ascending frontal gyrus**, the gyrus bounding the fissure of Rolando in front. Also called the *anterior central gyrus* and *transverse frontal gyrus*. See cut under *cerebral*.—**Ascending parietal gyrus**, the gyrus bounding the fissure of Rolando behind. Also called the *posterior central convolution*.—**Callosal gyrus**, a convolution of the median surface of the cerebrum immediately over the corpus callosum and below the callosomarginal fissure. It is continuous behind with the gyrus hippocampi, and ends in the gyrus uncinatus. Also called *convolution of the corpus callosum*, and *gyrus fornicatus*, from its arched or fornicated figure. See cuts under *cerebral* and *sulcus*.—**Cuneate gyrus**, a convolution of the occipital lobe appearing as a wedge-shaped figure on the median aspect of the cerebrum in the fork between the parieto-occipital sulcus and the calcarine sulcus. Also called *occipital lobule* and *cuneus*. See cut under *cerebral*.—**External orbital gyrus**, that part of the orbital surface which lies outside of the triradiate sulcus. *Gray*.—**Frontal gyri**, three gyri which compose the superior and lateral surface of the frontal lobe of the cerebrum, all lying in front of the ascending frontal gyrus. They are defined by the superior and inferior frontal sulci, and by the vertical fissure or precentral sulcus.—**Gyrus fornicatus**. Same as *callosal gyrus*.—**Gyrus quadratus**, the quadrate gyrus.—**Hippocampal gyrus**, the continuation of the gyrus fornicatus where it dips down behind and below the corpus callosum, and continues forward to the uncinate gyrus: so called from its relation to the hippocampus.—**Marginal gyrus**. (*a*) That part of the first frontal convolution which appears on the median side of the hemisphere. See cut under *cerebral*. (*b*) The gyrus which arches over the extremity of the fissure of Sylvius. See *sulcus*.—**Occipital gyri**, three principal convolutions of the occipital lobe of the cerebrum, separated by two small transverse sulci, and distinguished as *first*, *second*, and *third*, from above downward, or, as in fig. 3, *superior*, *middle*, and *inferior*. See cut under *cerebral*.—**Orbital gyri**, the gyri or convolutions upon the under or orbital surface of the frontal lobe of the cerebrum, which rest upon the orbital plate of the frontal bone. They are three in number, directly continuous with and corresponding to the frontal gyri. The two best-marked orbital gyri are sometimes distinguished as the *internal* and *external*.—**Parietal gyri**, four well-marked convolutions upon the superior and lateral surface of the parietal lobe; and especially two of these distinguished as the *ascending parietal* (or posterior central) and the *superior parietal*, the other two being commonly known as the *supramarginal* and the *angular gyrus*. (See other phrases.) In fig. 3, the superior parietal is called *posteroparietal lobule*.—**Quadrate gyrus**, a convolution of somewhat square figure appearing on the median surface of the cerebrum between the callosomarginal sulcus in front and the parieto-occipital sulcus behind, and continuous below with the gyrus fornicatus. Also called *quadrate lobule* and *precuneus*. See cut under *cerebral*.—**Sigmoid gyrus**, the somewhat *S*-shaped fold which curves about the lateral end of the cruciate fissure, and whose surface includes several constant and well-marked "motor areas": used especially by English writers.—**Temporal gyri**, in fig. 3, a general name of the temporal convolutions: usually in human anatomy more fully called *temporosphenoidal gyri*.—**Uncinate gyrus**, a convolution which appears on the median surface of the cerebrum nearly opposite the beginning of the gyrus fornicatus. It is so called from its shape, and the hook is known as the *crotchet* or *uncus*. See cut under *cerebral*.

gyst-ale, *n.* [Appar., < *gyst*[1], obs. var. of *guest*, + *ale*; but appar. also associated with *guise*, with allusion to festive mummery.] See the extract.

In Lancashire, we find the term *Gyst-ale*, which seems to be one of the corruptions of disguising, as applied to mumming, and in this sense the entire name, *Gyst-ale*, is confirmatory of Mr. Douce's observations. *Gyst-ale* or guising, says Mr. Baines, was celebrated in Bolton with much rustic splendor at the termination of the martlemas season, when the villagers, with a king at their head, walked in procession with garlands, to which silver plate was attached, which was contributed by the principal gentry in the neighbourhood.

Hampson, Medii Ævi Kalendarium, I. xxiii.

gytrash (gī′trash), *n.* [Origin obscure.] A spirit or ghost. [Prov. Eng.]

I remembered certain of Bessie's tales, wherein figured a North-of-England spirit called a "*Gytrash*"; which, in the form of horse, mule, or large dog, haunted solitary ways, and sometimes came upon belated travellers. . . . Close down by the hazel stems glided a great dog, whose black and white color made him a distinct object against the trees. It was exactly one mask of Bessie's *Gytrash*—a lion-like creature with long hair and a huge head.

Who might be *gyv'd* in such a golden string,
Would not be captive, though he were a king.
